```

> when I return home from the Service and far, far flung places.
>
> I was busy with college during the years that the CB world really got rolling. Occasionally, just for fun, I would tune across the CB Band, which even in those days reminded of Orson Well's "War or the Worlds" - thousands upon thousands of heterodyning carriers which rose and fell like an endless sea surf - an invisible electronic wind which swept across our culture, in waves, crossing class distinctions, sub-cultures, ethnic groups and political distinctions. In a strange sort of way, the CB band is something which is uniquely American - like Apple Pie, Mom and the Levy that was Dry. Freedom of Speech in action - however well or poorly it may have been used, or is used, for that matter.
>
> Even, today, periodically, I crank the bandswitchand swing the dial into the CB band, on dark lonely nights, when 160 Meters, 80 Meters and all the rest seem bleak and abandoned for a reality check that the human race is still there - still reaching out and touching, still wanting to communicate more than just RST, QTH, WX,TNX,CUL,73,SK....... One can criticize those whose only impulse is to communicate even if in a grotesque, vulgar way, but the important thing is that they are communicating, or at least attempting to.
>
> The CB'ers for all their strengths or weaknesses are communicators - they are using their spectrum to communicate. And, there are those who may not like how they are using the spectrum that they have but, no one can say that they are not using and that it represents unused or wasted spectrum. Like the sailors of the Ocean Seas, they are there floating on electronic waves reaching out, traveling, touching, being touched, listening, speaking, trying to figure out how to express themselves. Looking for ways to find new meaning to their lives. Or, maybe, surfing for a friend to hang out with, when there is no one else to hangout with.
>
> Black talks to white, woman talks to man, child talks to adult, feeling a freedom to do so that is often, even today, not so easy to do. If you think that it is easy to find someone to talk to, just go out on the street, or to a bar, or the supermarket and say,"Hello!" to someone. Chances are very good, that they will look at you like you're crazy. Also, there is a good chance that in their eyes, you are too old, too young, too fat, too skinny, too tall, too short - a classic case of the "Too-Too's" - all missing from radio communications. I talk to thousands of hams a year on the air and have no idea of how they look, or what they do or are, other than what they say to me. No idea what-so-ever. It's like a group of blind people sitting around in chairs talking to each other. But, blind to what?
>
> One of the more distasteful aspects of our culture is the idea that what we are, or what we do, grants us some kind of "elevation" with respect to other people. Some how, by doing "X" we are elevated - made more significant, more important, if you will.

> It is an idea that has seeped deeply into our culture, our societies, our groups and ourselves. It is not enough to simply BE, we must be SOMETHING. Strange isn't it? Somehow we are deficient simply by being ourselves. I wonder why that is?
>
> So, we go forth and strive and do and in so doing become associated with that which we are doing and merge with that, in the attempt to BE SOMETHING.
>

> "I am a Ham!"
>
> When someone asks me that question, say, at a party, I respond, "I am a Person!" I am long years beyond being an cowboy or an engineer or a pilot, or a soldier, or a skiier, or any of those things. But, I could still do any of them if I either had to or wanted to. But, I am not any of those things if I am not doing them. At the moment, I am a writer - for what ever that's worth.
>
> But, my life experience has taught me that no one ever got an inch higher in his own eyes by standing on somebody else's back, or their reputation or lack of one. In fact, in recent times, I have discovered that I don't even have to stand on my own back or reputation and what a relief that is!
>
> The interesting part of this whole "elevation" thing is that this evaluation does not cross occupational paths very well. A baker does not have any "elevation" to a plumber. A plumber has no elevation to an engineer, an engineer has no elevation to an astronaut. A photographer has no elevation to a world class athlete. Get it? The CB'ers have no "elevation" in the eyes of many Amateur Radio Operators, who have nice little government licences, which allow them to do something as a Priveledge that they should be able to do as a RIGHT, in a "Free Society."
>
> Interesting!
>
> Yet, this accomplishment gives them Elevation in their own eyes. But, I wonder if a Novice has as much elevation as a Technicial, or does an Advanced has as much as an Extra-Class? Hmmmm?
>

Ice Cold very true, I remember back in the mid 70's when CB was big the sunspot cycle really hurt the hobby the people who really were into it stayed and waited it out but lots of others dumped the hobby when skip ran rampant all day. I remember back a few years when the cycle was at a low when you got good dx conditions and couldnt wait to hear some skip again that month. Now its like give me a break with this .

GMRS is on the same freqs., go get a GMRS RADIO!  Save your self the
trouble. GMRS needs a liciense, some of your local GMRS types are worse
than your baddest ham nightmare.  Used by small businesses and people
like your friendly tow truck and taxi drivers.

Doug,
I believe what you are looking for is "QuickFix 3.0". Also, version 4.0 is due out soon. I do not own the program, so I cannot tell you about it. It looks pretty neat, though. Go here>>>http://www.efjdevices.com/efjdev.htm

Hope this helps....

How did you do the channel mod? I have a grant with an expo kid style mod, switching the crystal for 40 channels above and below the regular band. But this leaves a gap where the A channels would normally be encountered, and I thought you couldn't get more than 15 channels (or so) below ch.1 with only pll mods. Is this some combination of the two?
This is mostly just curiosity, I don't think I'd do the mod if I had it (I have enough channels to get away from most noise), but I certainly would like to learn it and file it away for later.
Thanks
Ben

Am in search of a Antenna Specialst Super Scanner CB base antenna.

Lost one when my tower fell and would like to replace it.

It is nolonger being produced so I am trying to find a new one that might be setting on someones shelf or a used one that is in good shape.

If anyone knows of any please let me know.

Thanks

Well Paul? I had a TS MOD V driver and it bled my neighbor like crazy and he's a couple of houses down the block from me. Because of the bleedover (and being that he was a HAM too) I decided to go legal. No power and modified station. The mobile radio is a little past tweeked but being that the guy I was bleeding on was a HAM (and if I was bleeding his phones, TV and stereo's, I was probably bleeding my next door neighbors as well) I decided to keep the station as low key as possible.

"Too many HAM's around town"... this is a true statment. Out here in these parts around the desert, the DXing is prime for HAMs. I can drive a mile in radius around my house and find close to 15 Amateur Operators (the last time I counted). There's a lot of retired folks around here who are HAMs judging by the 40+ foot towers and TRI-Band beams. And being in the desert, there are no hussle and bussel of the big cities, no skyscrapers, no re-barb for that fact to create non-optimum conditions for radio. The population is probably 25,000 (don't quote me on this). So, the probable ratio of Amateurs is very high.

The HAMs in this town are alright folks. Sometimes they come down to AM CB to see whats going on. Yes, we do have problem children but the HAMs leave it up to us to monitor and enforce the "Good Neighbor" unwritten law of running huge amounts of power and profanity. Actually, the HAMs here get a kick out of us as they listen while we "regulate". Most times the troublemakers go away for a while (which is nice). The alliance between us CB folk and HAMs are ok for now, I guess.

So all that in a nutshell (a little long-winded though) is why I try not to use any amplifiers off the station. Its better to stay in the "black" than to risk heavy penalties. Don't get me wrong though. I dig hearing alot of "BIG RADIOS" on skip as I sandbag but not yet for me. Better to keep the

```
neighbor smiling than to see them snarl at me.  2 pennies and a dollar
bill...

137... back out!

I can't speak for the CD ROM, but I would recommend Lou Franklin's books. They
are the bibles of the do-it-yourself CB mechanic. If you read his books, and
understand them, you'll be up to speed in a hurry. If you rely on one of the
"cut this/jumper that/tweak this/replace this" books you'll still be just as
fantastically ignorant afterwards and probably end up with a whipped CB radio.

Greetings!

Cobra 148's and Grant XL chassis types don't use "Audio Transformers" like their AM-only Counterparts. T1 is an RF choke to keep put RF and engine/power supply noise from the Audio chip [IC6] power supply line and smooth out ripple and wine while powering the finals - thats why it's so large, it's got a lot more current on it than the MB3756 regulator IC chip.

You might be getting this confused with the method of using a "Modulation Transformer" to generate the proper drive and impedance to work into the collectors of the Final and Driver in an AM only radio.

The 148/Grant AM audio output of the audio chip is driven into a power amp designed to act like a switch, and a linear amplifier at the same time while in AM mode.

When SSB is enabled, no audio power goes to the AM regulator, instead it's turned on like a switch and supplys full voltage to the Driver/Final.

This part is the AM regulator - and is used for CB radios with AM/SSB together. Works similar in function as a Modulation Transformer, but provides DC power, and Audio Amplification - as well as bias to drive the Driver and Final all while in the AM mode.

This is one of the failings of SSB type chassis like the 148 and Grant styles.

The AM only radios use a Modulation Transformer that can develop higher voltages without having current regulation. It can flat out-do an SSB radio in modulation and swing drive. Merely by using the Transformer in a fashion to supply current for heavy drive, and the voltage rise to help the collectors of the Final and Driver provide the boost needed to make AM-only radios so stellar in performance if properly "soop-ed up" right.

In an SSB radio, to keep things stable, they use regulation, both voltage and current are controlled to keep things tame...which limits modulation to a point, but the joy of having one of these radios is to combine more power into an audio Sideband, that the AM radios cannot do.

SSB radios use low-level modulation when in SSB mode. The term "low-level" is because of where it starts at. It's at the pre-driver mixer stage of the RF TX amp section, where carrier and Audio are mixed together and the carrier is filtered out, leaving audio - to be amplified in the subsequent stages. And is why in SSB mode, the Driver and Final get steady DC, with no audio - it's not needed nor is it desired, it's already been mixed to the right frequency and anything added to it causes problems.

I hope this helps explain why T1 is not the Audio Transformer - it's an RF choke designed to filter the power supply to the Audio Amp and Final/Driver.

So, if you're really looking for SWING, an AM/SSB radio is not the ticket to stardom. Use an older AM-only radio for the best results.

Most ham rigs have output stages very similatr to CB radios. Ham rigs with autotuners are an extra circuitry added. Generally in the form of a "L-Network". That is a series inductor with a shunt capacitor. The broadband PA stages of most newer ham rigs are less tolerent to SWR changes than older tube rigs. The PI-network of most tube PA's are more forgiving and can match a wider range of impedances presented to it. Solid state broadband PA are designed to be near 50 OHm and do not provide for much variation from that.

The antenna does not have to be resonant. It need only be matched to the characteristic impedance of the feedline. The matching network is at the antenna and not the radio or in between. In that case there is no reflected wave.

case in point. take 150 feet of chain length fence. There can be a matching network that will present 50 Ohms to any 50 Ohm coax. I seriously doubt that 150 feet of chain length fence is resonant. But there will be no standing waves.

****

Velocity factor is critical when using coax as lumped constants. It one were to use a chunk of coax as a capacitor or and inductor then VF is extremely important. If you are trying make the reflection coefficient of the transmitter zero then it will only help to start the coax trimming process.

For F1/F2 layer propagation falls off remarkably with the sunspots. E layer propagation actual picks up more in the minimum years than in the peak years. E layer propagation though occurs year round and is less dependant on sun spots. Much of the skip on CB is E layer propagation. E layer can exist in single and multiple hops thus giving some remarkable long distances.

The current guesstimate is mid-2000 at the moment and this cycle will probably not be as strong as the last one. This is subject to change....

Andy, good retort on the "swingin'" 148. I'll have to do some experimentation one rainy day. But, I'm so satisfied with the performance of my rig that I'm tempted to leave well enough alone. If I had 5 cents for everyone that told me I sound "choice" I'd surely have enough to buy a brand new Yugo.

> This is one of the failings of SSB type chassis like the 148 and Grant
> styles.

Amen. I use mine on SSB about 98% of the time. And that is maybe why I get my knickers in a twist over people using theirs for *only* AM. Seems like a waste.

> The AM only radios use a Modulation Transformer that can develop
> higher voltages without having current regulation. It can flat out-do
> an SSB radio in modulation and swing drive. Merely by using the

> the boost needed to make AM-only radios so stellar in performance if
> properly "soop-ed up" right.

At the risk of sounding like a man of contradictions, for shear personal amusement I have no qualms bastardizing AM only rigs. One time someone recommended the Radio Shack TRC-413. I did some experimentation and must say that this radio can sing and dance. I believe the audio power amplifier is good for about 7W so you can well imagine what happens when you apply all of that to a 4W carrier. I like modulation transformers and firmly believe the hysterisis in the transformer gives them a unique tone. Some radios, like some of the old Citizen AMers, use a tapped-winding, or autotransformer for the output modulator. Different approach but similar results. I like the tone on the old Sears and Citizen microphones. These were the devils with the rounded front and they sound really tinny. Love that sound!

Uniden Grant XL (3 banks of 40 channels no misses or dupes, +/-6kHz clarifier), Shure 590T, home-brew amplifier, Les Wallen Modulator antenna. Have notes on the modifications if anyone wants them. Also have some new Modulators and numerous other new mobile antennas including Sirio Turbo2000s. Email me.

Thanks for the input for all who replied.
I'm setting up my suburban. I have just mounted 2 X 165 altinators with 4x 8
vdc loco (2 16vdc) batteries. I built my own regulator but, I think I will
decide on some thing smaller because ofcurrent feed problems maybe a 24 pill.

Pretty much agree with the spirit of your post except one thing,
which I believe you have somehow gotten very misinformed about.

If I had a chirp in my CW note (or RF in my audio, or even some
QSB on my signal) I'd certainly WANT the other guy to tell me,
even if I knew. In fact, the last numeral in the traditional
cw RST report is used to describe the tone of the CW note. You
wouldn't send "599" to describe a chirpy signal, would you?

I've had chirp on my CW signal a few times when running BA
type rigs. In each case, I got helpful advice, not scorn.

I don't believe any CW op feels better when they hear a chirp
on the other guy's signal. There's no "elevation" involved, just
a simple exchange of technical information that helps us to
run our stations better.

>I will put the old Collins R-390 against anything that you have today.
>

I have a lot of respect for the R-390. For four years, I ran a communications center with 12 of these boat anchors, operating around the clock under adverse conditions. Very stable, great selectivity, etc.

But I very much prefer the modern Amateur gear. Sideband sounds much better on the new rigs, and there is something to be said for "flat" cw filters vs those with a peak--although I put the "ringing" signal to good use when being jammed.

I stand by my original post: The R-390 and the Motorola HF SSB are great for specific frequencies, but they are not so handy for searching out random contacts.

As for general coverage, I stand by my original comments on that subject, also.
 From radio magazines in the 30s, 40s, 50s and 60s, to the latest Amateur

manufacturers......single band rigs still enjoy popularity because they can be optimized over a narrow portion of the spectrum.

Here are some observations that i have made.

The RK 56B is more consistent in tonal qualities and noise canceling
characteristics from mic to mic.

The 636 is more ruggedly constructed, making use of a better cord and
switch.

Which one you choose is more a matter of personal taste and practicality.

Factory coax is typically low grade and VERY poorly installed. The excess
cable in the truck is typically wound into a large choke, drastically
altering the performance of the system. PL-259's are also very low grade
and have a tendency to pull off the cable after a while.

Hope this helps. Sean
>

Both work well, but are personal preferences.
Michael G. Heitczman wrote in message

I was just wondering what some peoples opinions were as far as what they think sounds better as a microphone in a truck ..... a RK-56B or Astatic 636L.....

....also does anyone have opinions on factory coax that comes installed in trucks

i'd appreciate some e-mail if anyone has time......Mike234@ix.netcom.com

Thanks !!!

I have tried MANY brands of cable. As James stated, the foam insulated cables have varied the most due to the varying densities. Sean
>.

prozac 625 wrote in message ...
I think you have been buying the wrong brand cable.

| Also keep in mind that most velocity factor ratings are simply that :

| RATINGS. I have had very few cables that actually matched the manufacturers
| specs. Most are ballpark, but not close enough if doing any type of
| precision work.

I like the RK-56B, and as for as the coax, I don't like the motorola plugs they
use to make the connections.

I have always told people it's not a good idea to run a linear
in the house. 4 watts messes with your neighbors plenty. It's
not good to stick out like a sore thumb. You already have a vertical
sign on the roof that says, "Pick on me!"

Uh.... No. I refuse to buy into that pseudo yuppie appliance. I have no justifiable need (nor do many other people) to be on the phone while I'm in the car, or standing anywhere else.

If you have a job (like sales) where your business depends on your availability and reachability, that's one thing. Personal use, is strictly a status thing. Plus it has been linked to brain tumors as well. No thanks! I'll stick to RADIOS!

I don't consider it a "failing". It's just a more convienient way of making modulation.

>

> the boost needed to make AM-only radios so stellar in performance if
> properly "soop-ed up" right.

High level modulation transformer radios can only "make more modulation" if there is sufficient audio drive wattage available. If you've only got a 4 watt audio amp chip, then you're not going to be able to drive more than an 8 watt carrier to 100% modulation, unless you remove the modulation from the final stage and trick up the driver and pre drive stages.

A better way to think about the difference in modulation schemes is that transformer coupled radios ADD power through modulation. Regulator radios regulate modulation from the supply line. If you short out the regulator in AM mode, you'll get a heavy carrier, of about 18 - 25 watts depending on the radio. That will be your PEAK modulation number as well (minus the .6V transitor drop) when the regulator is working. With that in mind, you should never set the carrier level above 1.4 of the peak power level, if you want to maintain 100% peak modulation

>
> SSB radios use low-level modulation when in SSB mode. The term "low-level" is because of where it starts at. It's at the pre-driver mixer stage of the RF TX amp section, where carrier and Audio are mixed together and the carrier is filtered out, leaving audio - to be amplified in the subsequent stages. And is why in SSB mode, the Driver and Final get steady DC, with no audio - it's not needed nor is it desired, it's already been mixed to the right frequency and anything added to it causes problems.

Careful! "low level" modulation usually refers to AM audio applied to a low level, pre drive section. In SSB, modulation is more accurately applied in the balanced modulator. Yes, it is technically "low level", but it also removes the carrier, which differs from what happens in AM low level schemes.

Wow! You're as bad as me (or maybe a little worse).

For now I run:

Yaesu FT-757
Icom 706
Uniden HR-2510
RS TRC-451
Cobra 139 XLR

And when I feel like being nostaligic:

Hy-Gain 623
Cobra 135
SBE Trinidad
Midland 13-885
RS TRC-30A

Or any number of junk mobile rigs that I'm playing with.....

Well if cb's are useless for emergencies then you need to use a cell phone or some kind of phone and dial 911.
As for me my job has purchased a pager and 2 nextel phones for me since being in the computer business they need to contact me regularly if there is a problem with the database. The only reason I got 2 phones was because I somehow convinced the boss it would be cheaper and my wife needs a phone too!!!

Well I dont know were your from but if you dont have to compete with locals that are in the same watt class as you or higher, then a 16 pill will probably suffice. Like guys in L.A. , Its seems like theirs a big station around every corner that you have to compete with. If your in a location were you have allot of guys keying up with you at the same time trying to catch the same skip as you it gets ruff, but if your in a area were your pretty much to your self then when condition in your area rolls in, all you need is a 8 pill doin 1500 or so and you can talk all day long.

Now if your lookin to shoot out, throw every thing I just said out the window!

bye,
KRS

Michael,

The Road King 56 and the Astatic 636 microphones are
identical in that:

they both use the same mic. cartridge

they both use the same ptt switch

they both take advantage of capacitive audio bandpass coupling

there is only ONE difference! the 56 uses a 5:1 step up

transformer and the 636 does not! This is why the output

level from the 56 is twice the output level of the 636!

```

Does anyone know where I can find specs for linears such as palomars, texas
stars, etc?
I've been searching on the web but couldn't find any.
Any links appreciated.

Anyone know of a web site that talks about CB etiquette, and how to talk to folks when you're out on the road?

-Thanks.

Took this unit in trade. Model SPU-416-KT, 438 -470 Mhz 16 channel programmable. The radio has three channels programmed, one repeater and two simplex. 4 watt output, scan, and PL. Radio, antenna, and battery only, no charger. Seems to be in good working condition and at least a 7/10 cosmetically.

I'm not really familiar with the Uniden line and the radio was identified by my description on line. Will sell for best offer or trade. Looking for SSB CB (40 ch only - no converted 23's) or amateur radio equipment.

FAQ:
No, I can't reprogram the radio, but I'll give you the e-mail address of someone that can.
Yes, it will cover 440 ham band.

Yes, it will cover GRMS channels,
Yes, it COULD be used as a 4 watt radio on FRS.(not legal or advisable)

Please e-mail offers or questions. Thanks

Jim, W8EMS/9

Aw now come on. Just think of the day when you have to have a cell phone. Don't you even want to know how to work it:)

Just funnin.

If you think you will get brain tumors with a cell phone, just think of what all that RF is doing to your body when you sit in your little tiny truck talking skip, with, well you get the picture.

Whew! I think this may be a cause for another government study. What do you think.

Happy CB land.
Happy Holiday and God Bless

In reference to the exact same switch used in the rk56 vs 636l.

The switch in the RK56b will undoubtedly fail within the first year of use.
This is the new one. The switch is manufactured by the same company that makes
the 636l switch with one distictive difference. The spring in the rk56 spring
is internal. The spring on the 636l is outside the working machanism. I have
found the the switch in the astatic mic will last longer and is fixable by the

average large fingered do it yourself person and a retractable ball point pen.

We usually use the 636l switches to change the rk56b switch when it breaks.

The tone on the rk56 can be a bit more on the tinny side where the 636l is a little bassier. The tin sound will help you cut through a little better.

The mic switch is opposite of each other.

The rk56 is a popular mic, therefor it may be the mic of choice in your area.

If you want rugged, durable and noise canx look at the BUM1. Also a mic Astatic puts out. Big Ugly Mic 1. That is the one I prefer. It does not cut my modulation out like the RK56 does. Therefore I can use this mic with ease and I don't have to shout. That's my flaw not a mic flaw. Good for the soft spoken person.

So there is my 2 cents worth. Its really what you prefer. There are slight differences in price too. Well maybe more than slight depends on where you purchase it.

I think that they are two very different mics when compared and tested. Take your radio in to the shop and ask them to let you hear the difference between the two on your radio. I do that for my customers when they ask.

Good luck and God Bless.
Happy Holidays.

Flip the radio upside down with the front panel facing you and remove the bottom cover being careful not to pull on the speaker wire, which you should dis-connect at that point. Near the front panel of the radio you will see a small circuit board that is elevated from the main board and is mounted inverted with its circuit traces facing upward. Remove the soldered tab that is connected to the chassis and serves as a ground, making sure that no solder drips or splats onto the main board below, then remove the phillips screw that holds the board in place and remove the board. Look on the component side of the board for a series of three small holes labled Con1, if the radio has solder filling hole one, remove it, and solder holes two and three together. It is very easy to confuse the holes because of the layout so be careful.

The modification is very easy, and what Eagle basicly did was to remove the three pins that pins two and three were shorted out on with a plastic jumper block as you would see on 2950 etc... and leave three empty holes there that you short out holes two and three with solder.

Thats it...the unmarked top center button is your band select, and you will have 10 bands of 40 channels. The LCR button serves as a -5 or +5 kc up or down adjustment. The other buttons function as marked. Do not crank up your AM power & SSB power!! Leave them as stock because this unit has no heat sinks and runs hot!!! Even with a 1.1 SWR it runs hot, so leave it at 4 watts AM, 12 watts or a little under SSB, or you will burn it up!!!! Leave your modulation limiter in place and crank your modulation pot fully clockwise. Run the microphone gain on maximum if using the stock mic, and hold the mic about 8 inches from your mouth and you will get out loud enough and clean enough that people will find it hard to believe that you do not have a power mic. Alot of features for the money!!   So Long.

I am in the process of putting together my Maco 5/8 and I noticed that they have it designed (or at least this is what I thought the instructions said) that the bottom section is held on by a hose clamp not one of those clamps like the other sections. If this is right, is that sturdy enough or should I make something better?

Thanks in advance

Mudpuppy

I wouldn't go above a strong 16 pill with two alternators.

Figure an alternator per 8 pills, and then you need to run your driver off another electric system.

Makes you want to suggest that people go get themselves their power
supply sorted then go match the amp to the supply!

>>>That is how the smart ones end up anyway!

100A per Kw will get you into the ball-park for average not peak current
drain.

>>>I figure one alternator per 8 to 10 transistors....  Then run your driver
off something else, and NEVER run a driver section inside the pumphouse.

One stage per box, please!

My neighbor just informed me that he could hear my conversation on the CB on his TV, phone, and stereo. He said it didn't break up his picture but he could hear every word I said. Would it help if I turn back the mod a little, raise the antenna, or buy a good filter. Since the picture wasn't disturbed on his tv I didn't know if the filter would help. I was thinking that the mod was below 38 Mhz anway so it would still come through. He's being pretty cool about it now but I don't know how long this will last. Some of you experts must have encountered this same problem and I would appreciate your advise ASAP.

Thanks a million!!!!

> But,thou would not have a mouse in your hand

Wrong.

Commodore had the mouse WAY before the Mac people in CuperWierdo ever
thought of it.

As a matter of fact, the MAC O/S is a clone of Broderbund softwares GEOS
(Graphic Environment Operating System), that was first offered for sale for

the Commodore 64.

> and thou would still have the zerox machine on the shoulder for your GUI
Clone

Nah..  We where modifying those WAY long ago with a TV on the screen for a
cheap and easy BW Laser Printer!

>
> This world and it's contents are brought to you by Apple

But, they where designed on a clone!

hehe

This subject has come up time and time again, so with out being redundant on the subject I suggest you spend $18.00 and pick up this book at www.rfparts.com  Its call RADIO FREQUENCY INTERFERENCE "How to finf it and fix it."  Its a wealth of information and you can go through it methodically and tackle each problem.

Hello JJ:  I'll make ya ah deal!

I'll fly you out here to the Mojave Desert CB Associations CB Break, and
you can tell all the boys what you really feel, or are you chicken shit?

Jay in the Mojave

How To Shower Like A Man
1. Take off clothes while sitting on the edge of the bed and leave them in a pile on the floor.
2. Walk naked to the bathroom. If you see your girlfriend/wife along the way, flash her making the "woo-woo" sound.
3. Look at your manly physique in the mirror and suck in your gut to see if you have pecs (no). Admire the size of your dick in the mirror, scratch your balls and smell your fingers for one last whiff.
4. Get in the shower.
5. Don't bother to look for a washcloth. (you don't use one).
6. Wash your face.
7. Wash your armpits.
8. Crack up at how loud your fart sounds in the shower.
9. Wash your privates and surrounding area.
10. Wash your ass, leaving hair on the soap bar.
11. Shampoo your hair (do not use conditioner).
12. Make a shampoo Mohawk.

13. Pull back shower curtain and look at yourself in the mirror.
14. Pee (in the shower).
15. Rinse off and get out of the shower. Fail to notice water on the floor because you left the curtain hang out of the tub the whole time.
16. Partial dry off.
17. Look at yourself in the mirror, flex muscles. Admire dick size.
18. Leave shower curtain open and wet bath mat on the floor.
19. Leave bathroom and fan light on.
20. Return to the bedroom with towel around your waist. If you pass your girlfriend/wife, pull off the towel, grab your dick, go "Yeah baby" and thrust your pelvis at her.
21. Throw wet towel on the bed. Take 2 minutes to get dressed. >>

Well it looks like i've been thrown in the trick bag this time! My radio has no board mounted on the side like you described, i knew something was wrong when i opened the radio up to mod it.

A friend of mine bought a Comanche Black Hawk.  (same radio) and his is the same way no board, there must be a new mod for these radios or they can't be modified.

DEFINATELY get a low-pass filter for YOUR radio! And turning down the
modulation a little would eliminate some splatter. You can always buy HIM a
HI-PASS filter from radio Shack.

C.B 'etiquette' went out-the-window about 10-15 years ago. It USED to be
very fun, and almost 'professional.' There were numerous CB clubs that held
meetings, and they even gave away equipment! But I guess times have changed.
Additionally, CB was EXCELLENT in the mid '70's. But I WON'T hold on to the
past. Now it is PURE chaos. Enjoy...

snipped......

I've been reading some of the posts about the Motorola unit and I was wondering who had this and is it for sale?

I'm not sure. I did hear something about hose-clamps once. Also, that
antenna IS NOT as broadbanded as an Antron or I-MAX. ALOT of people are NOT
happy with the V/58. I would HIGHLY recommend the IMAX-2000.

Any problems or complaints lately from anyone dealing with Left Coast Radio
?
I just wanted to ask and find out before ordering. I have dealt with them
last year or so with out any problems. I just want to be sure before I place
my order.
TIA for any comments or feed back.

Well, the computer has not lowered my radio use that much.  Of course, I have nearly the perfect setup.

My radio equipment sits less than a foot away from my PowerBook (within easy reach).  And I have the microphones for both radios (CB and Ham) mounted on a boom arm that reaches me while sitting comfortably at my computer.  And I have foot switches to key both radios sitting under my desk.

With this setup, I can type on my computer, and talk on the radio, without having to move an inch.  If I'm really busy on the computer, I can ignore the radio.  If I'm really busy on the radio, I can ignore the computer (or doodle on the computer while talking on the radio).

In the case of ham radio, the computer is an important part of the system.  I use it for packet and use a computer program to translate many of the digital modes heard on the radio.

Comuputers do not have to take over your life - there is still time
for other things, especially if you make the computer fit your lifestyle
instead of your lifestyle changing to fit the computer.

  I'd be a little careful making a statement like that, John.  The FCC
has been working its way down the radio frequencies over the last couple
of years.  First it went after the cellular companies.  Then it hit the
television broadcasters.  Last year it went after the VHF/UHF bands.
Now Hollingsworth is talking about increased enforcement in the 10-meter
ham band.

  If the pattern stays constant, we can expect the freebanders to be
next.  And then the CB band.

  They may not have enough money to go after everyone at once, but they
can target a specific segment, and a specific few individuals within
that segment, to make an example out of.

Texas star has a schematic for an amp. You can also find it on coax kids
site.

:+> > In an SSB radio, to keep things stable, they use regulation, both
:+> > voltage and current are controlled to keep things tame...which
:+> > combine more power into an audio Sideband, that the AM radios
:+> cannot
:+> > do.
:+> .......How is the voltage and/or current regulated in a SSB rig?
:+> .......Why can't an AM rig have hi power in its sidebands? Isn't
:+> that what you're doing when you increase the modulation?

The way I understand how this AM versus SSB function is handled,

The main drawback is for the Low-level modulation component to be properly amplified, the AM regulator needs to reduce power to offer some "headroom" so that you just don't hear carrier. Since SSB radios in the AM mode mostly produce carrier with some low frequency sub-audible tones [read faintly modulated form of carrier], that are filtered out in the front end, but are injected or bypassed, along with audio, into the AM regulator thru the use of the Mod amp section which handles carrier power ratio to audio level from a tap that goes to the balanced modulator from the final stage of the mic amp section.

Actually, all the audio delivered is thru the use of the mic-amp section to directly drive the AM regulator/Mod amp section whether AM or SSB - what? Read on...

The Mod amp section [glancing at schematic for PB-122 board] is the PNP transistor that uses the AM regulator output -a PNP like 2SA1012, and provides the regulation and audio envelope control.

The circuit driving this is like a follower design. When audio is applied, the NPN [usually a 2SC945] device conducts audio and this is inverted to the actual signal. So it's like the transistors' output is inverted and is placed against the base drive on the AM Mod Amp. This amplification can't occur if the Mod Amp can't be driven linearly. It'll act like a switch everytime you apply audio to it, this is how much gain and control this section has.

Thats where the AM power control comes in.

A DC bias is applied to the base on the NPN transistor, turning it on but in it's linear operating range. It's a small voltage. It's to allow DC and audio mixing to occur.

When audio and DC are applied together, the output varies within a given range - from steady DC, to DC + Audio component. This is then applied to the Mod AMP [that big "black box" in the back] and this is how the audio envelope is produced. With low-level carrier being mixed in at the driver.

Because of this design, you have little, if any, overhead to work with within the given level of performance and operating range these two transistors work in. Too much DC bias applied to the NPN, then the transistor conducts more inverted bias to the Mod AMP - and less audio can be passed thru this mixing stage. This in turn, is why less audio is heard when you drive carrier [AM power] too far. The DC bias level of the AM power output, and audio drive at the base, of the NPN follower - the audio level has to exceed the DC bias level for small signal amplification. The result is, you lose audio but gain carrier.

And is why AM regulator only allows a given level of carrier - set by the AM power section, and the DC bias present at the NPN follower - so AM power is less, with audio forced to drive linearly into the Mod AMP. This is why we have the Diode to provide a forward voltage drop to keep Bias from complete shutoff/cutoff and acts like a limiter to keep the Mod AMP forward biased all the time...

In SSB, this section is biased off, and the Mod AMP acts like a simple switch, where the low-level modulation generated by the balanced modulator section, can do it's magic and generate SSB due to lack of carrier [filtered out at the Audio IF crystal, and DC from AM power removed] and audio IF mixed in with PLL-IF to make the RF with hardly any DC offset [except for bias present at the base from the steady DC - usually set to 70mA at the most for bias drive to make it work like a class AB at the base of the Driver and Final].

Want to know some fun stuff? Check this out. Using SSB properly driven, the NPN/PNP pair is not really shut off, only the AM power DC bias to it is...then when you "re-apply" AF modulation to the SSB envelope, you gain more power from the type of drive this produces - the Mod AMP (the PNP) transistor can apply audio even when driven to the point of a switch, due to the bias level present and you can tinker with the SSB on/off transistor switch bias and resistance to change that...you can have a lot of fun with this...

To find out what I'm talking about, take a Modulation Meter, set it for dead carrier AM for that SSB radio, then switch over to SSB.

Then mess around with the ALC control, as you open all the way, the Mod portion of the meter goes flat when you yell and scream into the mike - why? Because the ALC limiter is not working the Mod Limiter section on the Mic amp section of the radio and in turn, that little NPN transistor [it's saturated fully on] - it no longer has control and if you turn down the ALC control, and watch a Power meter, you'll find the Mod returns, the best setting it to have Mod meter read at max, and at the highest spot of RF power to gain the most benefit from using this ALC control as you yammer and yell into the mike...fun eh?

[Kids' don't tell your parents to whistle into the mike while doing this...]

:+>
:+> > SSB radios use low-level modulation when in SSB mode. The term
:+> > "low-level" is because of where it starts at. It's at the
:+> pre-driver
:+> > mixer stage of the RF TX amp section, where carrier and Audio are
:+> > mixed together and the carrier is filtered out, leaving audio - to
:+> be
:+> > amplified in the subsequent stages.
:+>
:+> .....And all this time I thought it was done in the balanced
:+> modulator section.

...[...now I know you're teasing me ;-)... I have radios that have this scheme to produce AM audio and SSB using a Diode Balanced Bridge network]...

The filtering network, the way it's set up, only allows you to slide the carrier IF because the balanced modulator is still producing audio, both sides - but it's being filtered out to provide a steady DC bias to the Audio IF section that is re-mixed at the RF pre-driver section, as - you guessed it - steady carrier...Thats why there are so many of 'em little coils - one to control PLL IF for VCO control and Audio IF straight from the Modulator and thru the crystal filter(s) and why Carrier Balance control is so important.

Carrier Balance? AM Power? Well, I'm not trying to derail the whole mess, but the Balanced modulator can't do much on AM - only low-level and low-frequency - envelope control. The tonal and main envelope drive is set by the NPN/PNP AM regulator section using DC bias for linear operation for Audio with a DC component applied while in AM.

[If you offset the carrier balance in AM, you'll find yourself with a very crude form of Phase modulation - like FM with AM. So don't do this on your pride and joy HiPo miracle of a radio - you'll sound, as well as hear, a lot of noise from people yelling at you...]

The typical AM portion of the radio [read:AM regulated CB AM/SSB radios] in AM mode - act much like their Modulation Transformer counterparts, but are directly driven by the Mod AMP transistor into the respective Collectors of the Driver and Final pair.

Now, if you want to talk about Balanced Bridge Diode networks, I'm all ears! I've got a TS-3010 using this scheme...

Neat but a bear!

Regards!

 I have a Cobra 148gtl and a Cobra 220xl I would like to sell.  Both are
in good condition.

Make an offer.

Craig�

Greetings!

Trucks that have "factory" coax, check the designation.

For AM/FM antennas, they use RG-59 75 ohm stuff...

If it's RG-58 or similar - should be suitable for CB - but I'd
seriously inquire with the dealer first...

It's not the coax thats the main problem...it's the type of
connections and the quality used - that can make or break the system.

While Dancing with the Mouse on Mon, 6 Dec 1999 19:08:32 -0500, the

Have you guys seen the ad for the new small two way radios?  Their just like 2 meter handhelds and they work off cell sites which have repeaters.  It supposed to be much cheaper than a cell phone.

I think the point thats been discussed here the last six months is
that the FCC has not spent any money trying to eliminate amps on 11

meters because they don't have any to spend on it!

Your always free to donate money to them if you feel the urge...

If you have a 48" fiberglass whip in a Wilson 1000 then your already
in trouble because that is not the size whip that a Wilson 1000 uses.

The whip that should be used with a Wilson 1000 is 62".

Ignition noise, Dodge Caravan 99

Here is my English translation of my previous posting "Bruit d'allumage - Ignition noise"� Please excuse my bad English. My interference problem is in the same category that the one of Carl Salomon W5SU, with slight differences.

I've got a problem with a '99 Chrysler Dodge Caravan whereby a bunch of trashy noise gets into the receiver portion of my 2-way HF-VHF-UHF amateur radio transceiver, an Icom IC-706 (receives from 100 KHz to 450 MHz). This problem ranges up to the UHF band, giving a reading of S5 on the S-meter at 440 MHz. Its intensity varies with the RPM of the engine on the S-meter reading. When demodulating in AM (this mode is available on all frequencies covered by the radio), I hear a trashy noise whose frequency changes with the RPM. My vehicle is brand new: 10 000 Km (6000 miles)�

The noise ranges from pulse-type ignition noise, to trashy (computer-generated?) junk. The noise has to be radiated (picked up by an antenna) and I'm not getting it from the power leads...I've eliminated that possibility by temporarily wiring the radio to a marine battery, and the noise is still there when the engine runs. It only goes away when I disconnect the antenna. The magnet-mount VHF-UHF antenna is installed on the roof at the rear of the vehicle.

I tried some other receivers.  The original Chrysler radio is also much affected; I hear the RPM-changing noise on AM and I lose reception of weak FM stations with engine running. The cassette portion is NOT affected, confirming a radiated noise. My scanner receiver (connected on a 117 V AC external source) receives noise up to 1200 MHz (S-1 reading)! This trash obliterates any signals weaker than that, on each radio I tried.

I disconnected the alternator; the problem is still present. It seems it's not the fuel pump either; I tried to turn the ignition key to the RUN position, without starting the engine. No noise was generated. I built a small magnetic loop antenna (a coaxial cable looped on itself, the inner conductor connected on the shield, over a 3 inches diameter loop), connected it on the Icom receiver over a long (20') RG-58U coaxial cable, and used it to probe around the car. This revealed that the noise source is obviously the ignition system; I got a radical increase of noise with the loop placed near the cap distributor, the coil, the spark plugs and their cables. I receive a much smaller signal with loop near the computer, and nothing when near the fuel pump or its supply wires.

I visited my Chrysler dealer service center; they made some tests, most of those mentioned above (all of them are discussed on the newsgroups and in the ARRL Interference handbook). They checked the engine with a DRB tester: everything was OK. The vehicle is already factory equipped with resistive spark plugs and cables. The computer is built EMI-protected in factory. Engine, computer, and other critical components are well grounded through heavy braid. After consulting their engineering staff, they found nothing and have no idea of what to do now. My feeling is they are not familiar with the EMI problems, and don't really care about them.

My girlfriend had a cute suggestion: "Why don't you choose another hobby - stamp collection, for example?"� Hope I won't have to choose this solution� hi! I've done other mobile installations but haven't run into one as stubborn as this. Is this a unique problem to this vehicle?

Any ideas? Thanks for any assistance.

Well I just got done trading my digital cell phone for a Base antenna called a Cross Bow I belive. Also got a echo mic and a mobile midland for it. It wasnt worth the value of the phone but I figured I had to get started somehow. After christmas I am buying a Uniden Washington from a local here. I got talking to him on the cb and he made me an offer on it. He also offered to let me borrow and antenna and a mobile so that I could have something to get across town on in the mean time. But I turned it down and thanked him for the offer. Good to see that there are people like that out there. You run into the ocational ASSHOLE but you get that anywhere you go.

I usually set up a buffet table next to me rig so I don't have to go far
when I get hungry and this way I have a great verity of food waiting for me.
I also have a remote control that turns on the lights, TV, VCR, stereo,
computer, opens the garage door, sends the robot "Johnny 5" to the store,
With the click of a single button I can send hate mail to toll free, and to
top it off I mounted a but plug on my swivel chair.

I ordered a little Apache 240 from Copper two weeks ago and was told it is on back order until sometime in January. I e-mailed Massie Coppers president, and got a reply. He stated that, "the FCC is cracking down on certain models of 10 meter radios that look like a CB and the Apache 240 is one of them." He further said that, "Copper has gone back to the overseas manufacturer to make the Apache look more like a 10 meter radio." This SUCKS!! Does this mean no more cheap convertible Apaches and Sidewinders? Anyone know whats really going on? Anyone selling an Apache 240? Thanks

My method: Buy your self the 32 pill, then upgrade your system step by step. I have two 250 amp leeces for my 32 and a separate leece for the m800 driver. This setup will do some good numbers. As I learned from this NG that when I upgrade to more alts I will see better numbers. No problem you can

always add more alts down the road.
It makes more sense to upgrade alternators then your boxes. If you upgrade from a 16 pill to a 32 pill what use do you get from the 16 pill?
Nothing........................

The Motorola HF rig is primarily designed for communications on a relatively few preselected frequencies.  It certainly will be a fine radio, but will prob. not have the ease/freedom of spin-the-knob random tuning of a regular ham-type rig.  It will prob. have excellent selectivity and sensitivity, and is most likely optimized for the mode most commonly used in ship/long-range communications: SSB, in a channelized mode. Overall, receive & transmission qualities will prob be similar to those of the higher-end ham rigs.

Even "the best" CB rigs pale in comparison.  While HF ham & commercial rigs now use complex multiloop PLL synthesizers or PLL+DDS synths to achieve low "phase noise" measurements - critical for near-noise-floor weak signal extraction in a crowded band - most every CB rig I've seen uses a cheap lil' ol' PLL chip w/small steps (i.e, 10kHz or less).  A real PLL setup would have *large* steps - 100kHz or even more - for one loop and manipulate another one or more mixing loops or the other PLL's clock signal so as to get the desired finer (i.e., near continuous) frequency increment.

Multistage crystal filters?  Low noise mixers?  Naaah, costs too much.  From what I've seen most of these CB-type rigs have cheap $1.50 ceramic filters in the 2nd IF - when there *IS* a 2nd IF.  Seems that many (most??, don't know) SSB rigs run in a single-conversion mode with product detection happening as the 2nd conversion, instead of happening after the 455kHz downcoversion.  Another bit of selectivity lost.  Adjancent channel rejection and image rejection figures, intermod handling abilities, etc. are gonna have to be quite a bit worse on a typical CB or "10 meter" radio.

The assertion that single band rigs like CBs are better than wideband ham rigs is an apples-to-oranges comparison -  don't know any such single-band rigs that have the same level of circuit design detail that a full-house HF rig has.  Even the micro rigs and lower-priced entry-level and HF rigs (SGC2020, TS50s, FT100, FT840, IC707, IC-706, DX70, DX77, etc.) are gonna superior for weak signal work in crowded conditions.

But it'd be real interesting to take a variety of CB rigs and run them thru the same parametric product review lab testing that some of the regular HF gear goes thru.  I suspect the numbers would not be that great.   Does that mean these cheaper rigs can't pick up a weak signal?  Nope - a sensitive front-end combined with good skip conditions will certainly bring 'em in. But when bands are crowded and filled with heterodynes, noise & interference, etc. you do get what you pay for.  Are these cheaper rigs terrible? No, pretty good bang-for-the-buck.
But none of 'em are a Kenwood 940S either...

I think we can reasonably suspect there's more of a performance difference between a typ. $150 - $350 CB/"10 meter" vs. a typical entry level/micro HF ham rig than there is between these ham rigs vs. the best full-bore, full-priced, all-the-features ham or commercial-grade HF rigs.

Thumper,

Are you sure you want the 240? Wouldn't you rather get the Sidewinder?
The 240 doesn't even have a RF Gain control on it.

Paul

He has got enough to swing it forward, but if he runs a lot of key then it
will overload, the reason I say he has got enough, and this is said with no
disrespect, is because to get 96 pills to operate at their max possible
output would be a challenge in itself, let alone trying to find the right
amount of drive to aquire this.

>is one of them." He further said that, "Copper has gone back to the
>overseas manufacturer to make the Apache look more like a 10 meter
>radio." This SUCKS!! Does......"

The FCC over the past few months has been using a clause in their CB regulations that states " Radi equipment PRIMARILY designed for citezen's band use mst be "TYPE ACCEPTED OR FCC approved" for the CB service.  They have apparently "decided" that many so-called 10M radios ( the blatant ones that

```
have the 40ch dials, echo ect) are "Primarily designed for" CB operation &
therefore are non-type accepted cb equipment & therefore subject to
confiscation ect...even before you move the "jumpe"r.   A truckstop in Maryland
recently got a warning & unmodified Galaxy 10M "CB's" taken away using this
logic.   The maufacturers could "disable" the XMIT & put a lightbulb on top of
a Galaxy 88 & call it a fancy "Flashlite" , (untill you move the internal
jumper) , but these games won't seem to fool the FCC anymore....

My point exactly!!! The origin of this post was.... CB is useless for emergencies. Hence I replied use 911 instead period.
Obviously if cb is useless for emergencies then 911 should be a hell of alot better!!!

Yeah, just what this ng needs, more troll material to inflame those who
take life
seriously.

> They could now make it illegal to produce or sell 10 meter amps in the

It already is, but then they don't enforce the gun laws on the books
either?

  Then, expand the CB band to 80 or 120 channels.  Giving more
> room for one of the most crowded and highly used bands around.
Good idea, lets just expand the CB Band to 28.000 with NTIA allocations,
put in NB FM, viola 150 channels easy.

  As far as channels go; 35 trough 40 are usually used for SSB.
Sometimes 16 is used also (23 channel radios). A.M. and SSB
can not occupy the same channel without interfering with each
other. This channel usage plan is not mandated by the FCC. It
is just a gentlemens agreement that has been (for the most part)
used to stop unnecessary interference between the modes.

Is any tech familiar with this very compact 40ch AM set?

It's got an FCC approval badge on the rear and a name of Metro Communication Inc underneath.

A LC7120 pll and a 2SC2078 in the final.

Nothing to right home about but I'd like some suggestions of any tx tweaks to get a little more kick out of it?

It is my only solid state CB with a mod transformer.

Do you think I can drive a pair of 1446's with it?

These are used as drivers to 8 2879's in my much modded Pirate amp (compliments #12)

Any help appreciated.

Phil / UK

Bonjour mon ami, Chrysler has had several recall notices for excessive noise on two-way radio equipped cars. I don't know if it covers your specific model, but it would be worth looking at - call your local Chrysler dealer.

> I disconnected the alternator; the problem is still present. It seems
> it's not the fuel pump either; I tried to turn the ignition key to the

> with loop near the computer, and nothing when near the fuel pump or its
> supply wires.

I've never had to chase a noise problem this much, Daniel. I would suggest you find another minivan of the same year/model and do an A/B test to see if yours is excessively bad (it sure sounds like it is). I'm most suspicious of the ingnition coil(s).

> I visited my Chrysler dealer service center; they made some tests, most
> of those mentioned above (all of them are discussed on the newsgroups
> and in the ARRL Interference handbook). They checked the engine with a
> DRB tester: everything was OK. The vehicle is already factory equipped
> with resistive spark plugs and cables.

Aha! I know that in the past, typically if you are using resistor wires you should not be using resistor plugs. Conversely, if you are using resistor plugs you should not be using resistor wires. I don't know much about newer vehicles though so maybe things have changed.

MC

No acceptable offers received yet.  The Ht is still available.

Took this unit in trade. Model SPU-416-KT, 438 -470 Mhz 16 channel programmable. The radio has three channels programmed, one repeater and two simplex. 4 watt output, scan, and PL. Radio, antenna, and battery only, no charger. Seems to be in good working condition and at least a 7/10 cosmetically.

I'm not really familiar with the Uniden line and the radio was identified by my description on line. Will sell for best offer or trade. Looking for SSB CB (40 ch only - no converted 23's) or amateur radio equipment.

FAQ:
No, I can't reprogram the radio, but I'll give you the e-mail address of

someone that can.
Yes, it will cover 440 ham band.
Yes, it will cover GRMS channels,
Yes, it COULD be used as a 4 watt radio on FRS.(not legal or advisable)
Please e-mail offers or questions. Thanks
Jim, W8EMS/9

Greetings!

After reading the post, I've come up with some ideas and questions for you to ask.

Take a look at the Distributor cap, and remove it. Look underneath, at the rotor, there should be a static shield that completely covers all the base of the distributor that houses the sensor and the electronics. It sits below the rotor, and is stationary, it also uses bolts to mount it and keep it in place that use the metal housing as the shield and return for noise.

It's wise that you remove the rotor and the static shield to verify that water has not penetrated into the housing causing rust.

It's also a good idea then - after verifying that things are clean - to then take it to the dealer and ask about service bulletins and the addition of an EMI RFI filter - on the power supply input from the battery.

Some Fords [I know, yours is a Chrysler/Dalmer] also have a tang that mates with a 1/4 spade female, that an RFI by-pass cap is connected to, the wire lead in the terminal side, and the main body bolts to a convenient spot next to the terminal. You might be missing this part.

I'm thinking that the RFI shield may have gone bad, or there is an RFI by-pass cap that either is not connected, or is missing. Check with your dealer on this.

While Dancing with the Mouse on Wed, 08 Dec 1999 18:44:49 GMT, the Modem interrupted with an MNI from "ddufault_ve2bap <ddufault@dsuper.net>", and the MotherBoard buffered this to Video RAM:

:+>
:+>
:+> Ignition noise, Dodge Caravan 99
:+>
:+> Here is my English translation of my previous posting "Bruit d'allumage
:+> - Ignition noise"� Please excuse my bad English. My interference
:+> problem is in the same category that the one of Carl Salomon W5SU, with
:+> slight differences.
:+>
:+> I've got a problem with a '99 Chrysler Dodge Caravan whereby a bunch of
:+> trashy noise gets into the receiver portion of my 2-way HF-VHF-UHF
:+> amateur radio transceiver, an Icom IC-706 (receives from 100 KHz to 450
:+> MHz). This problem ranges up to the UHF band, giving a reading of S5 on
:+> the S-meter at 440 MHz. Its intensity varies with the RPM of the engine
:+> on the S-meter reading. When demodulating in AM (this mode is available
:+> on all frequencies covered by the radio), I hear a trashy noise whose
:+> frequency changes with the RPM. My vehicle is brand new: 10 000 Km
:+> (6000 miles)�
:+>
:+> The noise ranges from pulse-type ignition noise, to trashy (computer-
:+> generated?) junk. The noise has to be radiated (picked up by an

```
:+> antenna) and I'm not getting it from the power leads...I've eliminated
:+> that possibility by temporarily wiring the radio to a marine battery,
:+> and the noise is still there when the engine runs. It only goes away
:+> when I disconnect the antenna. The magnet-mount VHF-UHF antenna is
:+> installed on the roof at the rear of the vehicle.
:+>
:+> I tried some other receivers.  The original Chrysler radio is also much
:+> affected; I hear the RPM-changing noise on AM and I lose reception of
:+> weak FM stations with engine running. The cassette portion is NOT
:+> affected, confirming a radiated noise. My scanner receiver (connected
:+> on a 117 V AC external source) receives noise up to 1200 MHz (S-1
:+> reading)! This trash obliterates any signals weaker than that, on each
:+> radio I tried.
:+>
:+> I disconnected the alternator; the problem is still present. It seems
:+> it's not the fuel pump either; I tried to turn the ignition key to the
:+> RUN position, without starting the engine. No noise was generated. I
:+> built a small magnetic loop antenna (a coaxial cable looped on itself,
:+> the inner conductor connected on the shield, over a 3 inches diameter
:+> loop), connected it on the Icom receiver over a long (20') RG-58U
:+> coaxial cable, and used it to probe around the car. This revealed that
:+> the noise source is obviously the ignition system; I got a radical
:+> increase of noise with the loop placed near the cap distributor, the
:+> coil, the spark plugs and their cables. I receive a much smaller signal
:+> with loop near the computer, and nothing when near the fuel pump or its
:+> supply wires.
:+>
:+> I visited my Chrysler dealer service center; they made some tests, most
:+> of those mentioned above (all of them are discussed on the newsgroups
:+> and in the ARRL Interference handbook). They checked the engine with a
:+> DRB tester: everything was OK. The vehicle is already factory equipped
:+> with resistive spark plugs and cables. The computer is built EMI-
:+> protected in factory. Engine, computer, and other critical components
:+> are well grounded through heavy braid. After consulting their
:+> engineering staff, they found nothing and have no idea of what to do
:+> now. My feeling is they are not familiar with the EMI problems, and
:+> don't really care about them.
:+>
:+> My girlfriend had a cute suggestion: "Why don't you choose another
:+> hobby - stamp collection, for example?"� Hope I won't have to choose
:+> this solution� hi! I've done other mobile installations but haven't run
:+> into one as stubborn as this. Is this a unique problem to this vehicle?
:+> Any ideas? Thanks for any assistance.
:+>

I never posted here before, but I need some advise. Looking to buy a
10/11 meter radio for my truck. I believe I narrowed it down to a few
models..Since I need swing out of a radio for my 2 pill, the choices
came down to these: Virage 39(was told it swings to 50 watts)
Ranger RG-66(swings about the same) Connex 3300 HP or go back to a 77HML
Galaxy..I do not want to make a bad decision and be unhappy..Any coments
appreciated..................
ALAN

Yes, he had a good time with that.

Unfortunately, I have more bandwith than his ISP, which kind of threw him
for a loop.

And the SMTP server he used (in Hong Kong) was more than willing to give me
the log files from their proxy.

Made quick work of all the BS after that.

I'll take this vote. I'm sick of the "fear of the crash". I have to deal with this stuff every day at work. People are so damn stupid I wish it would all crash just so I could watch all the powder puff's riot out of fear. I do feel sorry for all the cops come 12:01 though....

Jon.

BZZZZZZZZTTTTT !!!  Wrong answers.....

>"they both use the same ptt switch"

Incorrect.  As was pointed out elsewhere, the same company makes both of their switches.  They are different switches though.  The switch used in the Astatic is more durable and tensioning spring is field serviceable.  The RK's switch is not as durable and basically becomes junk once the internal spring breaks.

>" they both take advantage of capacitive audio bandpass coupling "

The 636 does not have ANY capacitors in it.  The RK 56 does.  The capacitor is used to attenuate lower frequencies at a rate of appr. 6 db's per octave ( removes the muddy sound ), which typically makes the RK slightly sharper sounding.

>"the 56 uses a 5:1 step up transformer and the 636 does not!  This is why the output level from the 56 is twice the output level of the 636!"

Due to the 636's wider frequency response, it will typically drive the radio harder and produce higher levels of modulation ( and therefore greater peak power ).  This is especially true in radios that have wide audio bandwidth and people with deeper voices.  Bass reproduction takes greater current output levels than mid or high frequency reproduction and the radios audio circuitry responds accordingly.  While applying the RK's capacitor filtering design to the 636 may result in noticeably cleaner sounding audio in some cases, modulation levels ( peak power output ) may take a slight hit in the nose.

As someone else noted, the BUM-1 is a higher output mic than either the 636 or RK.  Since greater output requires higher sensitivity, it would also be LESS noise canceling and pick up more background noise.  Just for the record, i have discussed these differences with Mark  (the design engineer) and Scott (the vice president) at Astatic several years ago.  Sean
>

Jack Thurston wrote in message <384D3C3E.8BFE26EC@cybertrails.com>...
Michael,

The Road King 56 and the Astatic 636 microphones are identical in that:

they both use the same mic. cartridge

they both use the same ptt switch

they both take advantage of capacitive audio bandpass coupling

there is only ONE difference!  the 56 uses a 5:1 step up

transformer and the 636 does not!  This is why the output

level from the 56 is twice the output level of the 636!

I don't have enough time to type in all of the gear that i own.  Let's just say that i have mutliples of the following:  Yaesu's, CPI's, Browning's, Tram's, Dak's, RCI's, 2510's, Cobra's, Uniden's, etc....  The same can be said about having more than a few 10 / 12 tube Phantom's, Heathkit's, Black Cat's, etc...  How about watt meter's :  Bird's, Coaxial Dynamics, CPI's, Diamond, Mirage, Siltronix, Black Cat's ( BOY, do i have Black Cat's ), etc....  How about base antenna's ???  Let's see, i have some Jo Gunn's (beams and sticks ), Astro Beams, Sigma 4's, Wilson's, several Penetrator's, Turner Sky Kicker's ( now that's a nice antenna ), etc.....

I think you folks get the idea.  Yes, i am a junkie ( and a major pack rat ).  It's good to see that i'm not the only nut out here though.  I have to say that most of you folks have got pretty good taste in radios too.  I noticed more than a few people hanging onto their old 858 SSB chassis too :  )

If i remember correctly, Painkiller ( from Louisiana ) made comment on the NG about all of the radio gear that i have at home when he came up to visit. I do remember that he specifically wanted one base tube amp that i have. Needless to say, he didn't get it.  The power supply alone easily weighs over 100+ lbs and you could easily dump 1000+ PEP into it.......  I have watched # 12 dump 500+ watts into amps that are half it's size.

Speaking of # 12, I have to admit though that as much as i have, it is but a drop in the bucket compared to what Dennis has.  I have him beat in terms of radios and amps, but raw electronics and components......  Let's just say that RF Parts has less inventory......    Sean

He doesn't have enough, no matter the drivers.  Sean
>

-=PEAKABOO=- wrote in message <82ks9q$6a3$1@nntp5.atl.mindspring.net>...
There is enough current draw spared per alternator to do it with that many alts, he runs this in comp mode.  That is three 32 pills, if he ran 2 alts per 32 pills he would be running 6 alts, which by the time you include the drivers it is really cutting it close.

Ive got a local Ive been talking to hear on the cb. He has offered to give me a linear. However it needs the finals put in it. There are no cb shops where I am located. How much work is involved in doing it? Also if I do find someone that can do this how much would something like that cost? Hell I dont even know what he means by having the finals put in it lol.

Currently all I have is a ProStar 400 Import. It really does a god job for the $

I used to operate a ROBYN 520 base, It was a talker but it finally gave out and I was tired of fixing it.

I still have a President Grant with mods and no FM (does this mean it's a US model?) It does not work, but I hope to get it fixed one day.

******

The RK-56B comes with the same lightweight
mic cable that the 636 does.  As far as output,
the RK-56/B delivers almost 2x more millivolts
of audio signal to the low impedance input of
the transistor rigs on the market today.  I
don't know what you are smoking over there, but
you need to give it a rest.

i feel like this why do they make linears if they know that they can be used for 11 meter band...if they didnt want them used on the 11 meter band then they would make them different so they couldnt work on 11 meters

and besides the question was. What is a linear amp. not to get into an arguement over linears. everyone has their own opinion and they are fre to thank what they want to but not every person in life is going to share the same opinion as you do.

and theres my opinion

catch ya later but until then take care of yourself and each other.

I am looking for a used but working 12 volt 25 amp or higher power

supply. Physical condition not important as long as it works ok.
Please email me with what you have and your asking price.

Hello, all!

Well, I'm _almost_ a newbie.  I just
got my first radio since 1978 or so.

I have a Cobra 148 GTL ST and
am curious as to what channels are
used for SSB these days.

Thanks in advance,

Bryan

That's more or less what I'm doing, although, it's more like "All the
rigs that I drooled over and WISHED that I could own in the 70's", I am
now collecting in the 90's.

Still waiting for that yard sale Browning or Tram......

I'm glad that I'm not the only one with "the sickness" (as my wife calls it). I do have some limits though. I don't collect any old junk, but more of the "classic" radios that people swore by in the "good ol' days".

I have 2 858 radios. Hopefully the audio chips stay healthy, since you can;t get them anymore, although I have had some success retrofitting another type of chip, and rewiring the pins. I don't know if there is a pin for pin replacement.......

How is Dennis? I miss his contributions here. It's a damn shame what happened to him.

> Don't you even want to know how to work it:)

I know how to work the basics, which is all that I'd ever need. I like
the idea of a cell phone for emergencies, and would have one for just
that reason if I didn't have to pay a monthly fee to NOT use it. If
they'd come out with a "pay for the call only" cell phone, I'd keep one
just for emergencies. But then again, knowing MY luck, just when I
needed the damn thing, it would either
A. not work due to my being out of range, or
B. the battery would be dead.

> Just funnin.

Thanks!

>
> If you think you will get brain tumors with a cell phone, just think of what
> all that RF is doing to your body when you sit in your little tiny truck
> talking skip, with, well you get the picture.

I wonder the same thing with all of those "megawatt" keydowners. Just
what long term damage will happen when exposed to the RF field produced
by multiple killowatts in close proximity? I know I certainly don't want
to find out the hard way.

I'm hoping that my relatively low power levels, and the distance from
the antennas, will lessen my exposure to RF damage. Time will tell, I
guess.....

In my area, the skip doesn't completely fade out until 8 or 9 O'clock,
depending on what other atmospheric conditions are present. Sometimes
it's sooner, sometimes later, but 8:00 is the average.

They have those now.  You buy the phone, then you buy a cell phone card that has a certain amount of minutes on it.  I think they are advertized at like Target or Walmart or one of those type stores.

Hmm, is the radio in good shape?  You may have gotten a fair deal but something tells me you may have gotten the short end.  The crossbow is an old Radio Shack antenna.

What the FCC needs to do is take the 10 meter band away from amateurs.
They could now make it illegal to produce or sell 10 meter amps in the
U.S.  Then, expand the CB band to 80 or 120 channels.  Giving more
room for one of the most crowded and highly used bands around.

I don't know were you guys live but were I live the CB is the same.
Just people chatting lightweight talk.  Its always been that way.  A
few occasional morons piping in their ridiculous brain burps.

I heard something pretty funny the other day.  I think I've heard this
guy before to.  Anyway, its a guy on channel 38 LSB who just sits
there and about every 5 minutes keys the mic and says "Shut the f%@!
up."  He just keeps doing this over and over every 5 minutes.  He
doesn't yell it, he just says it.  It may be a digital sample that is
```

being played over and over because it sounds exactly the same everytime its transmitted.

That is true and false.  It has been noticed that companies inventories are going up due to the expected possible interruption in supply channels.  And at the same time, consumers are purchasing survival gear and such just in case the electricity/heat goes out.

Actually I have a CB base, 2 shortwaves, a computer, a scanner, a
stereo/tape/CD, a TV, a VCR, and real audio on my computer.

So, I have a pretty good choice of what I can listen/watch while
working on my computer.

Well, I cdon't know about the LED display off the flex, but the 'channel'
designation should be the same for a bunch of rigs. Like the Radio Shack TRC-449, TRC-457, and TRC-458. There may be variations in how the LEDs were 'attached' but even there it should be easy to figure out.

If you want the 'decode' for the channels, I can dig that out. From there
you can figure out anything else you need.

Good radio!
The SSB channels are channels 36 through 40. At least officially. And there is a LOT of traffic on them most days, and many nights, lately.
Some operators use the frequencies above channel 40 (27.405 MHz) which is not legal but a lot of people do it anyway. :-)
Have fun, and welcome back!
Mike

They are NOT the same cords.  Telex was originally using the same cords on the RK 56B model but changed them to a cheaper "look-alike" after the anniversary models came out.

If you don't believe this, take a new cord and barely slice it at the end. Look at the differences in how the Astatic and the RK cords tear or separate.  The RK 56B cords are softer material and don't hold up to flexing or strain quite as well.

As to the output levels, you may be correct.  BUT, the audio bandwidth is much wider on the 636 and i typically see higher peak power levels out of the 636 IF the radio has the capability to reproduce low frequencies.  As i said earlier, it may not sound as sharp but it would be louder and more powerful.

What happened to your claims about them both using the same switch and using capacitor based filters ?  Neither of those statements are correct.  Sean

>
Jack Thurston wrote in message <384E16EB.5B85F940@cybertrails.com>...
        ******

The RK-56B comes with the same lightweight
mic cable that the 636 does.  As far as output,
the RK-56/B delivers almost 2x more millivolts
of audio signal to the low impedance input of
the transistor rigs on the market today.  I
don't know what you are smoking over there, but
you need to give it a rest.

Jack

I'm glad that I'm not the only one with "the sickness" (as my wife calls
it). I do have some limits though. I don't collect any old junk, but
more of the "classic" radios that people swore by in the "good ol'
days".

I have 2 858 radios. Hopefully the audio chips stay healthy, since you
can;t get them anymore, although I have had some success retrofitting
another type of chip, and rewiring the pins. I don't know if there is a
pin for pin replacement.......

How is Dennis? I miss his contributions here. It's a damn shame what
happened to him.

THE QUESTION WAS WHAT IS A LINEAR AMP?

A LINEAR AMP IS AN AMP THAT OPERATES IN THE LINEAR REGION OF IT'S CHARACTERISTIC CURVE.

AN EXAMPLE OF THIS IS THE CLASS A AMP AND THE CLASS AB AMP WITCH IS A CLASS B AMP WITH THE LINEARARITY OF A CLASS A AMP.

I THINK YOU GUYS CAN PUT THIS TREAD TO REST NOW SINCE HIS QUESTION HAS NOTHING TO DO WITH THE FCC, OR AND THING ELSE YOU ARE TALKING ABOUT.

This topic is like the hands on a clock.

They keep coming around.

I think Steve or someone confirmed a couple of month's back that Dennis, #12, helped with a 'new' bias circuit which I believe was on the base amp's.

This refutes Boba's statement below!

Phil / UK

1.  Make sure its nothing but free

2.  Whats wrong with it....? Something since the pills are out of it.

3.  Should somehow get it checked out before dumping money into it.

I strongly suggest you pay nothing more than $0.00 (free) for it.  I've seen
many buy linears without the pills in them, only to find themselves buying
the pills, then they blow because of other faulty parts.  Depending on what
kind of pills this "box" requires (or can be put into it with little if any
modification) you could be spending a lot of money, and should just then buy
a known new "box"....

You better have more than a single alternator, even if you are working a
power supply...  I mean, Dead Motor Maul.

Besides, the 300A alternators take so much torque, they break crankshafts
putting out the same power that the 250s do.

Quit buying from coppers!
Dave!!!

Chris wrote in message
<10799-384E8F3E-22@storefull-217.iap.bryant.webtv.net>...
I ordered a little Apache 240 from Copper two weeks ago and was told it
is on back order until sometime in January. I e-mailed Massie Coppers
president, and got a reply. He stated that, "the FCC is cracking down on
certain models of 10 meter radios that look like a CB and the Apache 240
is one of them." He further said that, "Copper has gone back to the
overseas manufacturer to make the Apache look more like a 10 meter
radio." This SUCKS!! Does this mean no more cheap convertible Apaches
and Sidewinders? Anyone know whats really going on? Anyone selling an
Apache 240? Thanks

phil would you consider adding bias a major circuit change. I think it was
done mainly for ssb use on the baseamp it certainly is not for the keydown
amps performance. I have a davemade with class ab bias does that mean my amp
is any different than the others No its a davemade that is biased class ab.
We are beating a dead issue tho...

I am acquiring a Boomer Deluxe 400 Mobile amplifier.

I am told it is identical to a similar model Palomar amp.

It uses 4 Motorola MRF-455 devices and covers 80-10m.

Is there a service manual for this?  (The Boomer or Palomar.)
Cost and availability?  Info. online for these amps?

Specs:  Bias Circuit Class AB-1, Modes -- AM/FM with
automatic SSB detection.   Output is claimed
to be LO 115-135; Med 195-265; HI 385-435 PEP
Watts avg.  Drive -- 3-15 watts key-down, will tolerate
spikes up to 40 watts PEP.  25db RX pre-amp.
Current draw 25-32 amps.  Weighs about  5lbs.

Thanks! & 73, DavidC  K1YP

Something must be awfully wrong with my meters... I performed a 1000 turn winding on this ferrite (SOB) and needless to say, I came up with a 3.3125 uH reading.... HUH!! <grin>  Anyway... Im getting ready to send this damn thing to Amidon.... since Im sure they have a little more exotic equipment than I would like to have my hands on...

Some people don't get it, do they QRM?  The newsgroups are like a conversation.  It starts by someone introducing a subject and, once the subject is addressed, the conversation drifts from there to whatever is on people's mind about anything even vaguely related to that (and, yes, sometimes not related at all).

I guess some people expect rigid debate with strict rules.  That is not going to happen in the newsgroups - and if it did the popularity of the newsgroups would probably drop like a rock.

And do you, even for a moment, really think that is going to happen? Not a chance.  The 10-meter ham band has become an important utility band for all types of ham activity (satellite downlinks, repeater cross-band links, etc.).

Hello Adrian,

All you need to do is run a few jumpers in the same order as the ribbon went. This takes a little time but unless you stumble across another ribbon this may be the only way to put it back together.
Try to follow as much of the old one as possible and you'll be ok. Use a small diameter wire to make it easier.

D&D,

Why should I stop buying from Copper? Nobody else sells the Sidewider 400 for $130 or Apache 240 for $60. Should I also stop buying from JCRE and CoaxKid as well? I've never had a problem with Copper. They really do get a bum rap from you high priced Mom and Pop CB shops.

I talk to a guy on the radio who told me that he is having trouble with bleeding over on his neighbors telephone when he is talking on his C.B. radio. His radio is stock...but he does have a power mic. It gets kind of strange at this point...he says that his C.B. only comes through the phone, which is not cordless, when it is on the hook. When the receiver is picked up the bleedover stops completely. Not only does the bleedover occure only when the phone is on the hook...but this phenomenon only takes place when the C.B. transmitts on channel 4 AM, and the audio is loud enough to wake the neighbor from a sound sleep!  As you can probabley guess...this is causing more than a little friction between these two neighbors, so if anybody has a solution i would appreciate hearing it so i can pass the information on to him. Thank You

    I'm sorry Andy, I must be from another planet or something
'cause I couldn't follow a thing you just tried to say in this last
post.
    What little I could get from it only seemed to contradict
everything I think I know.
    Thanks for trying to illuminate this for me but alas, it was
wasted on me. Sorry.

I cannot help you as I have not seen this radio on the market yet.

Does anyone have any first hand experince with the Radio that Chump is
speaking of (Ranger 6900F)?

Good luck with it if you get one.

73's

Tipper

Since you are new, the first thing you need to do is sit down and read
the rule book before deciding you want to modify anything. Modified
radios are illegal to use for transmissions on 11 meters, despite what
all the know it alls might say about the subject. After all if they
couldn't modify and use illegal equipment, there really wouldn't be much
to talk about here, but in any event, read the rules before you do
anything you might later regret--if you violate the rules anyway, well,
at least you know you were acting outside of the law.

I guess your right but if he cant afford to buy an alternator he doesn't
belong buying $600.00 radios. My point is that he is most likely full of
shit.

They all have the same main board. make your choice between those by
features and price. if you want power stay with the dual final units.
you can identify those by heat sink mounted on the rear of the unit.

It was the night before Christmas, when all thru the abode
Only one creature was stirring, with the radio in RX mode.

The children were finally sleeping, all snug in their beds,
While visions of Dave Mades, and beams danced through your head.

The wife was snoring in front of the TV,
As you tuned in 27.025 on your CB

when all of a sudden you heard the reindeer hooves clatter,
you think to your self "Now what's the matter?"

With the D104 still clutched in her hand,
You descended the fireplace, and saw the old man.

"Ho-ho-ho!" cried Santa, "I'm glad you're awake."
"Your gift was especially difficult to make."

"Thanks, Santa, you say as his the snow on him makes you shiver."
"That's the Jo Gunns even UPS won't deliver."

Santa laughs pulls out of his sac,
A big ol' Card saying Merry X-Mas from PROZAC.

There are two ways to do this. One can be accomplished with the PLL and the other with the clarifier circuit on the radio.

Tell the group what kind of radio you have and let's see what we come up with.

Just wondering (about every time I turn on the radio) if the FCC has done any steps concerning enforcing the regulations for the CB band.  I hear many calls that sound like they are riding in the back of my pickup and then they say the call is from TX or OK.  Lots of watts.

Has the FCC done anything to anybody in the last ten years or so?

I guess I'm looking for a Charley story to scare my grand kids.

thanks for the come back sean,i do appreciate it.

On Thu, 2 Dec 1999 23:16:30 -0600, "Sean"
<bigfoot1@megsinet.net> wrote:

|I like these radios overall, but they do suffer from inconsistent soldering
|and smaller "lands" than on other boards.  This leaves less solder material
|to make contact and the greater potential for bad joints due to vibration.
|I am still working out various mods on these radios, as i don't get much
|time to experiment too often.
|
|Overall, these radios do more power than the current Galaxy models with dual
|finals.  They use a different digital echo than the 73's or 99's.  I prefer
|the standard analogue echo for best tonality, with the digital echo from the
|73's / 99's next and then the digital Ranger echo.  The receivers are
```

|typically pretty KILLER in terms of sensitivity.  If it's quiet out, they
|will hear things that only the early 858 SSB chassis could have picked up.
|With the current noise level that exists, the sensitivity advantage is of
|little use right now though.
|
|Be careful as to who you let work on your radio.  Most shops are major
|hacks.  If they do good work, they will offer a GOOD warranty on it.  Sean

Does any one know of a good way to study Morse Code?

I have no problem with the written parts of the novice, tech, and general
exams but I don't know code. I memorized the Alphabet but it doesn't seem to
help.

I ordered a little Apache 240 from Copper two weeks ago and was told it is on back order until sometime in January. I e-mailed Massie Coppers president, and got a reply. He stated that, "the FCC is cracking down on certain models of 10 meter radios that look like a CB and the Apache 240 is one of them." He further said that, "Copper has gone back to the overseas manufacturer to make the Apache look more like a 10 meter radio." This SUCKS!! Does this mean no more cheap convertible Apaches and Sidewinders? Anyone know whats really going on? Anyone selling an Apache 240? Thanks

Go download a shareware program for tutoring morse.  I can't remember where I got mine, but there were many to choose from.  So many it was hard to pick one.  There should be enough on the web to have something turn up in a search.

Please Toll Free your giving yourself to much fucking credit. I'm still here and I'm here to stay. If people want to start blaming me for shit I"ll show you a hell of allot better then fucking Email bombing. Then we will see who is here and who isnt. But like I have said right from the start I only come here to enjoy the post and maybe get some help on shit. It's the people like yourself that ruin it and fuck with people for no reason. If you dont like a post or if it sounds stupid to you because you know the answer and think it is an easy one well just remember you started out sometime as well. You didn't allways no shit about cb's either.

I just got a Workman TVI-2K TVI filter in the hopes it will prevent me
from getting into my neighbors' stuff. But I realize I'm still causing
interference on my own cable TV signals and stereo. What exactly are these
TVI filters good for preventing? only FM TV reception?

I can't believe this post has been here since 1:30 and the best reply is a "probably". This isn't the group I remember.

Chris, do not put anything on your antenna! The wiring in the Christmas lights can and will alter the performance of your antenna. The SWR you set when you put the antenna up will change with the introduction of metal objects near it. If you setup the antenna correctly, the SWR will only rise.

Next, the Christmas lights would have to be plugged into a wall outlet. What if something goes wrong and the wires short (touch) the metal antenna? What if you are on the key at that time? How about if you've got that brand new Silver Eagle microphone, the big chromed metal one? These are definitely things to think about first.

It is good that you asked. Putting Christmas lights on your antenna would not be a wise or safe thing to do.

The way i figure out electrical demands is as follows: Each 2879 requires 25 amps. Multiply the number of transistors x 25 and that will give you a good idea of what you really need in terms of current draw to run the amp. This would be under almost ANY condition and doing it on a daily basis with consistent performance. Whether or not you can do this economically or realistically in terms of an installation is another story, but it does give a conservative idea of what you'll need without ever stressing anything to the max. Keep in mind that this calculation is just for the amp, not including running ANYTHING else in the vehicle.

I do agree with your statement about getting a 96 pill to run to full potential. How would you like to gain match that many transistors ???
HAHAHAHA Sean
>

-=PEAKABOO=- wrote in message <82m7qq$6ms$1@nntp5.atl.mindspring.net>...
He has got enough to swing it forward, but if he runs a lot of key then it will overload, the reason I say he has got enough, and this is said with no disrespect, is because to get 96 pills to operate at their max possible output would be a challenge in itself, let alone trying to find the right amount of drive to aquire this.

The Connex 3300 HP and the Galaxy 77 HML use the same board. The other two radios ( Virage and RG 66) use identical boards, but they are different than the Connex and Galaxy.

In terms of power output, the Virage or RG 66 will PROBABLY do slightly more power than the other two. No guarantee's though, as every radio is slightly different due to mass production and parts tolerances.

The Virage and RG should offer better sensitivity and slightly lower noise levels on RX than the old style Connex / Galaxy boards.

Both of them need to have the boards ruggedized BEFORE they go out the door of the shop. Also make sure that you get a GOOD warranty before buying the radio and having it worked on. Sean
>
KOBAL wrote in message <82n73e$f5c$1@nntp5.atl.mindspring.net>...
They all have the same main board. make your choice between those by
features and price. if you want power stay with the dual final units.
you can identify those by heat sink mounted on the rear of the unit.

Dennis did make some changes to the input circuit that was being used, but 123 was unable to incorporate it into production models.  Efficiency was WAY up, requiring far less drive.  Even with very low carrier levels coming out of the radio, the amps wanted to saturate very quickly.  This would have resulted in severe overdrive in most cases.

Far too many idiots want to pile-drive their amps.  They have little concept of what saturation or IMD is.  This goes for people making amps also.  A perfect example would be boxes like  2 x 4's and 2 x 6's.  No need for something like that if the radio is running better than a walkie-talkie. One driver transistor with a decent radio will more than drive them into saturation if the circuitry is efficient.  Sean
>

PowerStation <8675309@aol.com> wrote in message ...
phil would you consider adding bias a major circuit change. I think it was done mainly for ssb use on the baseamp it certainly is not for the keydown amps performance. I have a davemade with class ab bias does that mean my amp is any different than the others No its a davemade that is biased class ab. We are beating a dead issue tho...

This can be done, but isn't worthwhile.  It would do slightly more power,
but the driver section of a 667 is severely detuned as it is.  You would
need to do quite a bit of work to really see a major difference once you
changed the pill.

That is one of the reasons that Dennis and I recommended using a Mod V+ to
drive their 500.  It will do measurably more power and do it cleaner.  Sean

A linear amp is an amplifier that has a signal input and a signal output. The output signal has all of the characteristics of the input signal (linear) but is of a larger amplitude than the input (amplifier).

Linear simply refers to the signal being amplified without distortion. However, if you overdrive the amp you distort the output, and it is no longer a linear amplifier.

RF energy can be dangerous (health hazards/interference), and Ham operators are supposed to be trained to operate them safely. Not always the case, but that is the reasoning behind the initial rules.

Well, this is a strange one.  I assume you mean that the neighbor can hear his transmission through the speaker of the telephone handset.

The obvious answer, at least until a solution can be found, is to stop talking on channel 4, especially during the hours of darkness (let the neighbor get some sleep).

Now, the problem sounds like it may be in the telephone itself.  The guy may want to take his phone over to the neighbor's house and plug it in.  If the problem is eliminated with another phone plugged in, the solution is for the neighbor to get rid of the cheap phone and buy a better one (tell him this gently).

Check to see if the neighbor is using a long extension cord between the phone base and handset.  If so, try changing back to the stock cord. If that eliminates the problem, have him buy another length of extension cord (the cord he has may be the perfect length to act as an antenna).

Tell the guy to take a good look at his own setup.  Is his antenna and radio properly grounded?  A poor ground can lead to interference on a neighbor's electronics.

What about relocating the antenna?  Can the guy move his antenna further away from the neighbor's house? This could mean raising the antenna higher or moving it to the other side of the yard.

Just some ideas to try. Hope it helps.

Do FM wireless mikes interfere with either cellphones or 49 MHz intercoms?

Probably simple question: our church group stages Christmas-concert-like events where the performers use FM (170MHz?) wireless microphones and the stage crew uses 49.830MHz intercoms. Lately we've been encountering intermittent buzzing interference through the mikes.

(Incidentally, the intercoms also have been getting interference on the "A" (49.830MHz) and "B" (49.845MHz) channels. It sounds digital, so I suspect it could be from neighborhood R/C cars. Switching to channel "C" (49.860MHz) seems to aoivd the problem.)

The sound guy (usually a DJ volunteering his time) says the buzz from the mics are because of the intercoms. Another is saying it's due to cell phones in the congregation. Does either explanation seem reasonable?

It doesn't seem likely to me -- the harmonics don't add up -- but then, what do I know? Thanks in advance.

A filter will only reduce the level of noise present - it does not usually cut it completely.  Now, if the interference is minor, these filters will cut it enough to eliminate the problem.  But, if the interference is severe, the filters will not cut it enough to stop the problem.

The level of attenuation is often based on the price you pay for the filter.  In general, the more expensive the filter, the more attenuation it has.  To eliminate severe interference, you want a filter with a high attenuation capability.

Of course, first take a good look at your radio setup - it is always better to solve the problem without filters if possible.  The main cause of interference is a poorly grounded system.  Are you antennas grounded? Is your radio grounded?  Is the power supply grounded?

Remember that we're referring to a RF ground, not the negative ground of the radio.  This means a good ground wire/strap ran from the housing of the radio to the outside and connected to at least one copper rod driven into the ground.  The same with the power supply.

In the case of the antenna, we're talking about a ground wire ran from the base of the antenna to a ground rod.  Or you can also often just ground the antenna mast itself since the antenna is usually mounted directly to it (the mast can act like the wire).

And then check the quality of the signal put out by your radio.  Is it over-modulated?  If so, have the radio adjusted by a good technician. Over-modulation causes harmonics, especially when amplified (see below). Harmonics cas easily interfere with other electronics.

Are you running excess power.  In many cases, the radio equipment used in the citizens band is not built to a high standard of quality.  If a linear is used, it amplifies whatever comes out of the radio.  If the signal is "dirty" due to poor design of the radio, the harmonic garbage will be amplified right along with the desired signal - usually to the point of causing problems, when it did not cause problems at the lower power levels that the radio was actually designed for.

There are many books on the subject of RF interference.  You may want to hunt one down to learn more.

Does Dennis not have an internet connection at home?  I would think a
person such as him would.  Then again, I can understand why he would not
want to come back to this group even if he did.

Just wondering,

Cobra 148F GTL mobile CB radio with Freq counter , this has upper and lower sidebands , the radio has the deluxe dual stage echo , Donkey fart roger beep , regular roger beep , Plays The Bonanza theme from a chip toy , also has the high priced "Repeater" which you can record up to 10 seconds of the incoming recieve then play it back (copy Cat stores it then play it back any time , re-recordable ) , also has channels mods above and below the regular 40 channels , has talkback , external speaker , Astatic noise X mic , the power has been turned up (keys around 4 watts swinging to 12/20 watts (depending on meter) , with the modulation opened up too , this is fully loaded and is a clone of a Galaxy 88 radio , if you look at it and a galaxy they look a like . This radio has been used by me and works good , it is in good used condition with all switches mounted on bottom of radio (6) , plus the channels are in the places of a few of the not needed push buttons on front , the radio has so many toys the speaker had to be removed , the radio is for someone that wants a fullboat modified radio with alot of toys , a copy of the owners manual is included . These radios are not made anymore and are very hard to find , don't let this one get by you . There is over $650.00 invested in all the toys and work done . buyer pays Shipping/insurance/packaging of $15.00 in lower 48 which is 1st class shipping Priority US Mail..................................I'm asking $300.00 for it

Why don't you just use some computer ribbon cable?  It's flexible, small,
and easier than using many single wires...

Hey DH,

You will find this newsgroup to be a LOT like CB. If you don't like people f*cking with you, sell your radio now! You don't want to push me, either. I work at an ISP and I can find out anything about you with one phone call to Logical.net the parent company of Capital.net. I still have access to the full whois listing, not the abbreviated version you now get. Remember, mail bombs are illegal. So is harassment. That is what your actions amount to. Lucky for you I've been real busy this week...

A recap of actions:

"Nobody can find where I'm coming from" -Spiker

"You are around Albany, NY" -Unit 69

a bunch of sh!t from Stephen in the NG.

285 "Lame Toy" messages in my mailbox which I deleted and ignored.
----
Where did I cause you any grief? (yet) Your actions were unwarranted. Get a life. The radio and the NG are entertainment.

```

My advise to you is this, Do the following step by step until the problem is sloved.

1.Have your radio checked out buy a good radio tech and have the radio put into alinement.
2.Install a copper grounding rod outside the window of your radio room and ground all your equipment to this rod.(not the ground on the power cords)
3.Install a good Low Pass Filter into your coax.This would be that last thing in-line before your anntenna.(RF Parts has a nice one)
4.Install a High Pass Filter on any T.V. set you my be coming over.($5.00 at radio Shack)
5.Install chokes on the speaker wires of your stereo equipment.
6.If all the above don't work, then you are putting out too much power for your area.

Good Luck

>I just got a Workman TVI-2K TVI filter in the hopes it will prevent me
>from getting into my neighbors' stuff. But I realize I'm still causing
>interference on my own cable TV signals and stereo. What exactly are these
>TVI filters good for preventing? only FM TV reception?

I had heard that somewhere. I don't know if this was made into a law, or
if it is regional in nature and up to the whim of the cell carrier. I
guess I can't really try it unless I have a real emergency. I do have a
deactivated cell phone from when my wife worked for a cell company,
which still works enough to get the standard "if you would like to sign

up for service" messages. Heck, I'll stick the phone in my glovebox and
if I ever need to dial 911, I can try it.......

It would seem from your post, that Copper doesn't sell the rig for that
price either. You don't have one do you?

I could advertize any rig for $10, and if I tell everybody that I'm out
of stock, backordered or busted by the FCC, I can still be the guy with
the best prices in town (but never actually sell anything).

Just found my old trusty 2950 in a box in the garage, after thinking it got lost in a move after a year and a half. Anyway, I can't find the power cord for it, and the old mic is gone too. So, anyone got some spares, for a good price? Thanks...

> Current draw 25-32 amps. Weighs about 5lbs.

these draw a lot more current than they should. somewhere is some real ineffecincy. mine did about 300 watts ssb on a rms meter driven by a hr2510. sounded good but it heats up real bad. if you have a big enough supply and a fan it will be a nice little amp.

Good luck and best regards from Tim 082.

I recieved a Cobra 148GTL from a friend and there is no power when you turn it on. He said that the + and - on the radio were hooked up backwards once and it hasn't work scince. Does anyone know what I should look for and how to test it in the radio to find what went bad? Please help because this radio was just killer. Any info on anything would be great! Thanks and 73's all!! Please send to oneqck76ta@aol.com as I don't get mutch time to check this MB.

You tried this on eBay, where people usually bid way more than an item is worth.... I'll give you $180.00 for it... Dont care much for the work done, that counts as depreciation.... as far as it being a Galaxy 88 clone, why do you keep saying that..? Does this thing have FM? Im assuming then it has some sort of variable/selectable RF power knob/switch? I assuming then it also has a 10 kHz + switch? 4 swinging 12/20?

In other words, a more realistic price (if you plan to sell) would probably be....

| | |
|---|---|
| $90-$100 | 148 F GTL (used) |
| $40-$50 | Repeater |
| $25-$30 | Bonanza |
| $30 | Connex (real Connex) |
| $25-$30 | Mic (used is used) |

Dunno.... Try and ask for $220-$240 for it.... But good luck with getting $300.00...

I am about to purchase a Connex 4800 DX, but I thought I'd get some opinions on it first.  The radio will be used both on 10/11 meters for SSB.  I've heard that it uses the new "6900" mainboard which, according to the dealers wanting to sell me the radio, is a big improvement over previous boards especially for SSB.  What, if anything, makes this board so great?  Also, is it true that the Connex 4800DX and the Cobra 148F GTL DX+ are totally identical, and, in fact, come off the same assembly line?  What about quality?  Are these Malaysian or Chinese manufacture? Any thoughts, opinions, or experiences regarding the Connex 4800DX/Cobra148FGTLDX+/6900 are appreciated.

I went to download.com and came back empty handed. I will keep looking.
I also got some good advice via Electronic Mail.

At present I have an old Cam Cobra 88, 23 channel, and one of those fiberglass 5/8 antennas. At the "time" when almost every body had a Cb, I sold 'em from my home. So I ''went thru'' a bunch of

them, I see the big units now on ebay, and would kind a like one, but what 'stands out most' in my memory is how a Pearce -Simson Pussy Cat with a TU G8 D104 sounded. I sold one to an operator here in town about 6 miles from my house, he had his antenna at about 40 feet, but was on a slight hill, every time he keyed the mic it sounded like someone kicked a bass drum. I could not believe it . I just ''knew'' he was running power. As it turned out it was just a case of 'everything working together', When we (local cbers) were coming into town, his station was ALWAYS the first station we heard......
that was quite few years ago, and if I had my " drethers" I would like a
station like that. What is funny , I sold those units (about15) around here, now I cannot find one. To sum up, that "Station" is the one I wish I was talking on. Just my nickel. C. Lorentson

Thanks for all of the responses. I've decided not to put the lights up.
I thought that the Xmas lights might keep the ice and snow off the
antenna this year.

Anyone ever deal wth Lakeview.

I bought an On The Glass CB antenna 4 months ago. The antenna mast snapped off. I called and asked about warranty. They immediately accused me of hitting something with it, which I did not. I have two (2 meter & scanner) other antennas placed right next to this one and they are just fine. I am sending it back to them so the "can examine it" (per the manager), to see if I hit anything. Then they will decide if they will replace it then.

The antenna cost is $17.95.

Your thoughts are appreciated.

When some one says small changes are they talking about replacing a 50 Ohm resistor with the 100 Ohms in parallel? Or do they just relocate the position of the components?

Goto the software section, there are too many to choose from, none
really all that good. I use "stormy weather softwares" morse trainer. Its DOS,
which sucks, but I like how I can configure it to my learning style.
Doesn't use soundcard, just built in speaker.

Bob.

It sure is a good radio. A great radio. Stable SSB and great clarity on all modes of operation. Loud and Clear modulation. I have 2 of these radios and they both perform in the same great way. Search Deja News and check out the other posts on them.

See where you got your name. 3 of your postings all have two things in common. They all allude to you telling someone to get "REAL", or you asking someone if they are for "REAL". Seems like you need to get a grip on reality, "BUB"! Secondly, they are all directed in a facetious manner toward a post and you really don't say anything pertaining to it. Like you just want to take a barb at folks. You just got keyed on..............skip-wise.

With that kind of poor customer service, and with all the other compitition out there, I think it would be safe to say, DON'T DEAL WITH LAKEVIEW ANTENNA COMPANY! If enough radio enthusiasits take this position, I'm sure it will hurt their business.

The radios on Ebay alone are going for $175-$225.00 , and everyone knows how much the toys really cost and how much  all the work done would cost a person in a shop , I have no intention of arguing on the board , that is not what this board is for . The radio was up for Auction and brought $255.00 , close to the $300 reserve , If no one wants it here ,  it will be relisted on E-bay , My feedback that has been turned in on E-bay is assurance that your getting quality .

Thank You all for letting me post the rig and have a nice Holiday season.

They got me in '95,they are very good to deal with and treated me so well that I couldn't help but change my ways.That and the fines if I didn't cooperate.
The agent I dealt with(Mr. Anderson from Washington state)said they were more interested in people on freqs they shouldn't be on but amplifiers and intentional interferance were also biggies,although way down the list.

<<Does any one know of a good way to study Morse Code? I memorized the Alphabet but it doesn't seem to help.>>

People think they should be able to get it all right away, and when they can't, they just give up. It doesn't work that way. It takes a couple of weeks. Try listening to slow code (from a tape, software, or off the air) for ten minutes or so. Write down any characters you recognize. Don't sweat what you miss. Then review the morse alphabet and numerals at the end of the ten minutes. Do this several days in a row, and you'll find that each day you recognize more and more. Within two weeks, max, you'll have it down solid. Good luck.

I recommend "Jerry Ziliaks(KB6MT)high speed code course.I tried some other things then got his tapes and went from 0-20WPM in in 5 months and only played the tapes while I drove my mail route,didn't even pay attention!

The key is they start out at a 20WPM or so character speed with long spaces and then shorten the spaces,the way the ARRL and other courses work the characters sound way different at 5 than at 20,you have to keep learning the language over and over instead of just ......
well its like listening to a person talk that pauses a lot verses someone who never leaves a break,the language is the same but one gets a lot more said.

The hardest part will be unlearning what you know.

Advanspec,
Well you do have a point. Copper is a little high when it comes to shipping. But say for instance, I buy a D-104 M6 from Copper for $39 and add another $6 for shipping, comes to $45. Why shouldn't I buy it for $45 from Copper verses $70 for the same item at the local OVER PRICED cb shop? How much do you sell your D-104's for?

How fast were you driving? Was the antenna frozen at the time? My neighbor snapped a solarcon glass mount off last winter that was iced up.

Pro Am antennas are easier to adjust.  You only have to do it once.

| <<Does any one know of a good way to study Morse Code?  I memorized the
| Alphabet but it doesn't seem to help.>>
|
| People think they should be able to get it all right away, and when
| they can't, they just give up. It doesn't work that way. It takes a
| couple of weeks.  Try listening to slow code (from a tape, software,
| or off the air) for ten minutes or so.  Write down any characters
| you recognize.  Don't sweat what you miss.  Then review the morse alphabet
| and numerals at the end of the ten minutes.  Do this several days in a
| row, and you'll find that each day you recognize more and more.  Within
| two weeks, max, you'll have it down solid. Good luck.
|

The real irony is that all of those "mods" and "toys", while incuring an additional cost, do not increase the value of the radio to any serious radio user. The radio would be worth more to me in bone stock condition.

All that the work means to me is that the radio has had many hands inside, and the performance and/or reliability  is likely to suffer as a result.

This is what you have to keep in mind when you are selling something.

Would you pay double the going rate for a used car, that was adorned with fuzzy dice, chain steering wheel, hot 2 tone custom pink paint, a "la cucaracha" horn, custom wheels that are not to your liking, shag interior, and seat covers (also in pink)? These things all cost money to install, but they do not add to the value of the car to anyone other than the person whose (strange) taste created it.

Please tell me another one. Go for it I will love to see you try and link
anything back to me. If your so damn good lets see how good you are. I never
tried to impress anyone actually. I came on here looking for help and to see
what other cb'ers were like. A selected few of you have nothing better to do
then to come on here and start shit with people. What people on here think
of me is there problem. But I dont sit around and take shit from anyone
especially on the fucking computer. Im here to get help and possibly find
people to talk to on the cb. If you want to be here to fuck with people then
so be it. But you fuck with me and I"ll fuck right back.

AOL has parental control right?  May seem rude to say, but you should enable
it if you do not want your children to be subject to fowl language.  I
believe its this way on the CB also.... I may be mistaken there..

Besides, sh*t and b*tch used to be used (way back in the day) all the
time... it is only society that considers words in the english language as
"rude" or "inappropriate."  Evolution is a great thing isn't it?

For Sale:

RFI Book by ARRL, latest edition $20 plus $3.00 shipping. Loaded with information on finding and eliminating RFI intereference to and from devices. RFI dealing with Computers, Phones, Transmitters, TV, VCR, Stereo and so on.

Have some older (used) CB type books too for those interested. The older ones are like the CB for Dummies type books. These are going fairly cheap. About 10 cents to about $2 each depending on size (and age).

Have some CBs for sale. Older ones. Working, some in pretty decent shape. NOT modified. Most are 40 channel, one is 23, maybe a collectors item for those of you in to that. Bases and mobiles am and am/ssb types.

Miscellaneous other items too, from time to time.

C.L. Furlong Enterprises
514 Railroad Street
P.O. Box 289
Stockdale, PA 15483
E-Mail: Tech@DP.NET
Phone: 724-938-7808

2 way radio, cb, ham, audio repair. parts new and salvage (to fix the old stuff). Hamfest and Flea Market table year round. Consignment sales too.

If PA resident, you must include 6% sales tax. Payment accepted is strictly via Postal Money Order which gets immediate shipment. Mail comes in at 10:30 am, UPS and Mail goes out at 3:30 pm. Shipping on any items sold is extra of the price given on any item unless it is stated (SHIPPED) or (SHIPPING INCLUDED).

If interested in something listed or looking for something special, give me a yell and I'll see if I have it or know of where to get it. I often hear others here that have items up for sale. Please reply direct e-mail as I don't always get to read the newsgroups. Also, I have done business with many over the various radio newsgroups. Feel free to inquire before doing business.

Thanks for taking the time to read and above all

HAPPY AND PROSPEROUS HOLIDAYS TO ALL!

9 years old in Fresno CA., my Porta Rican step dad from New York city used to have old 23 channel? I remember I used to listen to him with his gift of the gab. The only time I would talk on it was when he would go in the store and I would wait for him in his old Barracuda and key up on channel 19 and piss off the truckers! I was a little kid and I would get scared, when my Dad would get back he would ask me what the hell I was doing hiding under the back seat. Then around 21 I got married and homeboy from South Central named California Cool Aid who talk on the radio gave me a Idea, I was trying to settle down so I got into the radio so I could get out of the house but still be at home for the ol' ladies sake. I started out with a swapmeet Realistic Radio "Navaho" for $10.00 with a coat hanger for a antenna. Serious. Got key on and now I am 31 have been doing the radio thang ever since. And yes I am still married and yes I am still getting keyed on.

Tune into some QSO's in progress and try to copy the slower ones. As your proficiency increases, look for faster speed QSO's. Start in the Novice areas of the bands, then move out to the General/Advanced areas, and just copy QSO's. W1AW has practice sessions on 1.818, 3.5815, 7.0475, 14.0475, 18.0975, 21.0675, 28.0675 and (yeah, like you'll receive THIS) 147.555. Their code practice schedule is posted in QST magazine. Pick up a copy and check it out. Also, Gordon West publishes some good code tapes. Not sure where you can find them, but I'm sure that QST has an ad or two for them. There's also some PC software that you can use, SuperMorse being one that I played with...

No acceptable offers received yet. The Ht is still available.

Took this unit in trade. Model SPU-416-KT, 438 -470 Mhz 16 channel programmable. The radio has three channels programmed, one repeater and two simplex. 4 watt output, scan, and PL. Radio, antenna, and battery only, no charger. Seems to be in good working condition and at least a 7/10 cosmetically.

I'm not really familiar with the Uniden line and the radio was identified by my description on line. Will sell for best offer or trade.

Looking for SSB CB (40 ch only - no converted 23's) or amateur radio equipment.

FAQ:
No, I can't reprogram the radio, but I'll give you the e-mail address of someone that can.
Yes, it will cover 440 ham band.
Yes, it will cover GRMS channels,
Yes, it COULD be used as a 4 watt radio on FRS.(not legal or advisable)
Please e-mail offers or questions. Thanks
Jim, W8EMS/9

My dad had one of the first CB radios in the Louisville, KY area.  Must have been about 1959 or 1960.  This was a four channel crystal controlled radio made by Vocaline, I believe.  He was on channel 7 - the only crystals in the rig - and sometimes you could go all day and never hear anyone else on the channel!

Then, in the summer, skip started to roll in and I heard stations from all over the country.  You could tell by the call letters, at that time, what state they were located in, and this got me hooked.

Dad "upgraded" his radios in about '61 or '62 and bought a pair on KN2550's from Allied Radio in Chicago.  Six channel transmit with 23 channel tunable receive.  Wish I had one of those now, just for the sentimental value!  Remember his first call was 18Q1843 (how many remember the "Q" calls?) and later changed to KHD6106 when the FCC decided that the number call signs didn't match the international allotments for the USA.

Got my first ham ticket in 1964 while in high school, but have always enjoyed being on CB.

Huh?  A co-phased antenna system is bi-directional by nature.  A
single antenna is more omni directional.  If you think that by using
two antennas on your truck, you are making your system _less_
bi-directional, you are sorely mistaken.

Did I stutter? If so I'm sorry I tried to say # 7. Every one was coming back
to him say that he was all they heard..
He was using my old 16 Pill and 2 Driving 4 driver. Hell I even think he was
using my old tiny built coils.
And guess what he is only using 1 250 amp alt for the hole system.....

Hi, I have a pair of RCA tall-bottle 20LF6, Great Britain,  both are identical
and in original boxes, un-used.

   Price 65.00 shipped for the pair, in 48 state USA.

  Please respond privately if interested.

   Regards,
         Joe Pratt, Tubecntral@aol.com

Nine years ago, while I was stationed at NAS Moffett Field, I use to run with a fella "Arizona Drifter" who was also stationed there.  We were four-wheeling in the Sierra Hills behind Milpitas when we got stuck.  I didn't have my bulky cell phone with me but Drifter had a GE Base station radio (it had both AC and DC power input) hooked up inhis truck.  He said he'll try and call for help but I told him we're too far to get ahold of anyone.  But he tried anyway.  Next thing you know, about oh, say 45 minutes later, a whole "shabang" of trucks came out in a line to where we were at to help pull us out.  Nicest bunch of guys I've ever met.  I forgot most of their names but everytime I come through the South Bay, I try to break for one of the guys I remember to this day, RECOIL.

But anyhow, the GE Base Drifter had in his truck was bought by me and I bought a GrantXL from Scanners Unlimited up in San Carlos (which I still have to this day) for the mobile.  And ever since then, I've been a "chronic" CBer.  Day in, day out the radio needs to be on; whether it be the station or the mobile.  That's my profile.

Sir Mix A Lot:  He sings about fast cars and fast women. In 1992 he came
out with Mack Daddy containing Baby Got Back, a song that sold over 2
million copies. While he sings about sex and women, he doesn't sing about
drugs. He actually preaches *against* drugs.

Albums:
Chief Boot Knocka
Mack Daddy
Return Of The Bumpasaurus

Seminar
Swass

Songs:
1. You Can Have Her
2. Da Bomb
3. Buckin' My Horse
4. Mob Style
5. Top Ten List
6. Man U Luv Ta Hate
7. Bark Like You Want It
8. Bumpasaurus Cometh
9. Bumpasaurus
10. Denial
11. Aunt Thomasina
12. Jump On It
13. Aintsta
14. Sag
15. Message To A Drag Artist
16. Lead Yo Horse
17. Playthang
18. Funk Fo Da Blvd.
19. Slide

Soundtracks:
Judgement Night

Singles:
Baby Got Back
Jump On It

Compilations:
Beavis & Butt-Head Experience
Bust It 2
Def Rap
Hard Rap
MTV Party To Go Volume 3
Rap Attack
Rap: On The Lighter Tip
Rap: Straight Outta The Ghetto
Straight From Da Streets Vol. 1

1969 12 years old. Mom and Dad were introduced to it by a few relatives. Started talking on it with their supervision, liked it and started getting hungry for more. Thus started getting interested in Electronics and eventually got my ham and commercial tickets as well.

Old set - Lafayette - first a 2 or 3 channel job, then a Comstat 25A.

Does anyone know where I can find specs for linears such as palomars,
texas stars, etc?
I've been searching on the web but couldn't find any.
Any links appreciated.

Would have been about 63 or 64, my scoutmaster and all the guys in the local jeep club had them, around these parts a lot of people couldn't get phone service without paying big dollars until the mid to late 70's,so everyone had CB's. I started out with an old 1 channel General, Then went to a Johnson 5 channel whiteface, on a big radio night , you'd slide the case off that old Johnson,and have all of your extra crystals ready to change to get more channels,used to keep mine on a flat piece of Styrofoam pirated from my mom, pushed them right down into it, then took a pen and marked the Styrofoam with transmit and receive, and what channel , ah for the good old days lol, one of the scoutmasters had co-phased super magnums, up in big Douglas fir trees at about 110 feet, sure seemed to work well with his Lafayette, and a homebrew 500 watt amp,  73's

I've never seen any list of specs, and I would surmise that you won't find any. These things are built on kitchen tables and garage benches by numerous individuals whose workmanship and design might be suspect. They will vary from unit to unit, and because they are illegal, people are quite happy to get what they get.

The television coax is supposed to be a sealed system. No rf gets out and no rf gets in. By putting a pass filter in the coax line, you will accomplish nothing if the coax was installed correctly. More likely, you are seeing fundamental front end overload, meaning that that your rf signal is getting into the TV directly through the case, or secondly, that the rf is coming in on the electrical line.  I presume that you are operating an unmodified radio with legal power and that it is grounded properly? For starters, you need to see what can be done in your own home to clean up the tv reception. For the stereo speakers, modify the length of the wires running to the speakers, and it should improve the situation because the wire will no longer be resonant on that frequency.

The local guy here has a patent on this "loudspeaker removal" technology and you have to pay him $100 royalties if you do the same to your rig.

For software, go to qrz.com. Beyond that, look in the back of QST for
the box ad for Ziliac's code tapes. Spelling isn't right here, but
you'll find it. Good tapes. Finally, learn to listen to the letter's
sound as it rolls out, not for dits and dots. If using software, set it
up so that it sends the letter at about 14 words per minute, but spreads
the letters out to about 3 words per minute. Learn to listen to the
sound of the letter and then speed up the frequency that the letters are
presented to your outer limits.

> instead of just one.

(there is no point feeding the balanced modulator with only one signal)

> One is the rf carrier frequency that was generated prior to the balanced modulator and the other is the modulating audio frequency. Since there will be two sidebands generated at the output of the balanced modulator there needs to be a way of removing the unwanted sideband. This is accomplished by setting the carrier frequency to one side of the xtal filter's passband. What then happens is the opposite sideband is removed due to the sharp filter skirts of the xtal filter. The new signal is now mixed up to the wanted output frequency and linearly amplified all the way up to and including the final and driver stages.
>
> The modulator/regulator that was used in AM is also now in play except that it is now biased to put out the max rail voltage. i.e. The switch you were referring to. There won't be any audio voltages applied to the base of the modulator/regulator transistor like AM so the voltage on the B+ line to the final and driver will stay just dc at max potential.
>
> I realize I've left out a number of details but this is my rendition of what happens on TX between an SSB and AM signal.
>
> How far off am I ?
>
> BobC

By George, I think you might have it! Of tantamount importance is appreciating that the SSB filter is very, very narrow and performs a band-pass function. If you hack and slash the microphone audio circuit in the radio you can increase your audio bandwidth. But remember the person on the receiving end is listening to your signal through a very sharp a filter (okay some radios are crap and aren't too sharp) and if your bandwidth is wider than the receivers' filter, the fidelity of your Tx signal is going to be degraded. Another thing to consider is that some radios route the AM signal through the SSB filter so an overly wide AM signal is also going to be more difficult to copy with a "good" radio.

If you LEARNED the phonetic alphabet you already have gotten off on the wrong foot.I have seen people try to memorize the phonetics and this is ridiculous,its much easier,simpler and more effective than that....When you here the phonetic for "A" for example(alpha,america,etc.)just start writing the word and stop after the first letter! Thinking about what letter is meant by a particular word takes a fraction of a second longer.It was never meant to be something to be memorized or learned,but a new way to use something you already know.The ARRL and others do a mis-servise by printing the phonetic alphabet but what would you expect from a bunch of no-coders?

NO,in fact 11 meters opens up every year for sporadic "E" and this is one band where all sorts of enhanced propogation will occur unrelated to the cycle.

Actually removing the speaker and running an external is a common way to get room for other things,this is used a lot on the 2 meter band when a handheld needs a tone-board installed,also the speaker in the speaker/mike can be cannibalized.

F#@KING GIBBERISH!!!  Common good my ass!  Radio is radio, HAM or not.
Communication, the last time I checked, served for a common goodness.

>  Yes, all of these might benefit some CB'ers.  But, for every CB'er
>shouting for increased power, there is another person complaining about
>interference from CB radios using increased power.  For every CB'er

>complaining about the interference by people breaking the existing rules.
>

Another form of GIBBERISH!!!  There are two types of people in this world.
People who do things and people who talk about doing things.  And you're all
talk DWIGHT!  I've yet to meet a CBer who would "bitch" about interference
or breaking existing rules.  And with the growing demand for state of the
art recievers (TV, Telephone and Home Stereos) the quality of RF Sheilding
goes down with its price and thus bleedover from a 4 watt Cobra2000GTL.

>  When Amateur Radio is added as an existing option that can meet all of
>the demands for increased range, power, and frequencies, there is

I also believe this is why some Cobra 148's and radios of this type show
amplifiers doing monster watts.

You stupid transistor people....

Q=Quality Factor.

hehe

Actually, we are both right.  If you are designing a matching network, the Q (Quality Factor) would stand.  If you are looking at it from a solid state reasoning, Q would be what you are describing.

Toll Free

Handy Andy <CodysPC@Iserve.Net> wrote in message news:384da578.88107004@news.iserv.net...

> Greetings!

Just for grins here's my interpretation of what happens.

On Am, (assuming a SSB rig) the carrier is generated by unbalancing the balanced modulator IC so that it puts out a carrier. The frequency of this carrier is set to make it centered in the xtal filter's passband. This ensures minimum attenuation through the filter.This frequency is then mixed up to the wanted output frequency.

Once at the wanted output frequency, the carrier is amplified through successive stages till it hits the driver and final wherein the modulation is applied. The driver and final's job is two fold. They amplify the carrier and are used as mixers. The mix being that of the carrier and the audio frequencies used to modulate the carrier.

There are a number of ways to impress the audio onto the carrier. The most common ways are through a transformer or by direct dc.coupling the audio amp to the final and driver's B+ line.

I think I'm safe in saying that xformer coupling is not generally used in present day SSB rigs. So this leaves dc coupling of the audio amp to the B+ line.

In the average dc coupled circuit, the final audio power amp is biased to provide enough dc output voltage to the final and driver so they can amplify the carrier to a nominal level. This bias voltage is adjustable to compensate for variances in gain of the previous rf gain stages.

Modulating the carrier is pretty straight forward from here. You apply a small audio voltage to the base of the modulator/regulator which causes the output of the modulator/regulator transistor to change voltage at an audio rate. The B+ line is now carrying a combination of DC and AC much like the xformer coupled circuit.

With a few differences.)

On SSB, the balanced modulator is this time fed with two signals instead of just one. One is the rf carrier frequency that was generated prior to the balanced modulator and the other is the modulating audio frequency. Since there will be two sidebands generated at the output of the balanced modulator there needs to be a way of removing the unwanted sideband. This is accomplished by setting the carrier frequency to one side of the xtal filter's passband. What then happens is the opposite sideband is removed due to the sharp filter skirts of the xtal filter. The new signal is now mixed up to the wanted output frequency and linearly amplified all the way up to and including the final and driver stages.

The modulator/regulator that was used in AM is also now in play except that it is now biased to put out the max rail voltage. i.e. The switch you were referring to. There won't be any audio voltages applied to the base of the modulator/regulator transistor like AM so the voltage on the B+ line to the final and driver will stay just dc at max potential.

I realize I've left out a number of details but this is my rendition of what happens on TX between an SSB and AM signal.

How far off am I ?

BobC

Yes! They work for 911 even without activation.
I carry an old one in my truck just for that purpose.
Got it at a hamfest for $5.00

I went from zero morse to 10wpm in one month - and I can't even remember my birthday! I didn't bother practicing the sending part but I did use the method where the letters are sent quickly but with lots of time between them. I'm firmly convinced that anyone can learn code. Allocate 20 minutes a day to copying random letters (slow at first and then faster) and just do it every day and you'll see.

Having read this I just *have* to open my big mouth...

>> The radios on Ebay alone are going for $175-$225.00 , and
>> everyone knows how much the toys really cost and how much
>> all the work done would cost a person in a shop

Well, there are always people that can easily be separated from the contents of their wallets. I wouldn't give a lot of the EBay crowd high marks for knowledge - methinks half the people there buy an item, and then try to flip it for an even higher price.  Guess they can't get real jobs.

You're also assuming sane people really *want* this butchery. Please let me know the bidder list on this item - I wanna sell 'em glow-in-the-dark chrome-plated Jesus statuettes to coordinate with their chain-link steering wheels on their dropped 72 Chevy Monte Carlos so I can retire early ;-)

A used radio is a used radio.  Mods *lower* the value - at least to me and many others - because I don't know who the hell did the work.

>> The radio was up for Auction and brought $255.00 , close to
>> the $300 reserve

Well, that just means $45 towards sanity, and/or a ridiculous reserve.

>> If no one wants it here, it will be relisted on E-bay

Fine. Please spare us another posting here.  If we wanna see what's on EBay, we can easily go there.  Most all here really know what the intrinsic value of such an item is.

>> My feedback that has been turned in on E-bay is assurance
>> that your getting quality.

Hold it - pure utter unmitigated BS.  An EBay rating doesn't imply *ANY* technical competence or even morality on the part of buyers & sellers;  it usu. just means that both the buyer got a box that works - possibly marginally - and the seller got his money on time and the check cleared.  It in no way means that the item is a good deal, that it's a good product, etc. - it just meant that two parties followed a few rules in an artificial marketplace not necessarily populated by knowing, informed buyers - like many of those that hang out here.

[COMMENT:  In fact from some of the listings I've seen, I've come to believe many EBay ratings are the result of "mutual assured blackmail" - complain or post neg. info about a deal, you may get flagged in your EBay Feedback as "whiny" or "demanding" and "don't have good communications skills". (Perhaps it's better than nothing though, dunno.)

d104m6b? 49.95 wired and we even throw in a battery if you ask for it
and an in store warranry you can trust. a little higher than copper
but if anybody wants to save that buck or two more power to em. we
have sold thousands of them at that price for years.

All those gadgets are quickly tiresome and will never be used again.
Then you just have a radio with a much better chance of having
something going wrong.

The Wilson 1000 is a great antenna.  The wattage rating is what the maker of
the antenna says it will hold.

Huh?  A co-phased antenna system is bi-directional by nature.  A
single antenna is more omni directional.  If you think that by using
two antennas on your truck, you are making your system _less_
bi-directional, you are sorely mistaken.

The Antron DOES have a metal collar and 2 metal places where the
fiberglass sections meet.

<snip>
It's an Antron 99 - fiberglass antenna!

here`s one

i took my cobra 25 in for some repair work  the tech said two days for the repairs  i left the radio next day i heard on the tv news that the shop was on fire
i lost my radio in that fire the shop owner keeped the money  no body was given any money for there radios destroyed in the fire
the owner disappeared every thing that was  in good shape  was sold at auction  i wound up with a lot of cb radio parts but the store room where the fire was where mine & everyone`s radios were this happened two years ago

They have made a reasonable request. Don't act so offended.

Send it back, and let the group know their decision.

>
>Has the FCC done anything to anybody in the last ten years or so?
>
>

Yes.  About five years ago, there was a big sweep of radio shops in the mid-west, with some confiscation of equipment and heavy fines.

There was a sweep in 1998 in New York City where taxi drivers were using illegal radios for dispatching. They moved into the Amateur band and the FCC and Taxi Authority took swift action.

Among individuals being investigated, it is as the other responders have reported.  The number one way to get the FCC's attention is to interfere with another radio service or with TV/Radio reception.

Justin, I guess that answers your comment about it possibly being the local home channel. :-)

Well, Bend.., he is just going to have to find another channel until he can get the problem fixed (it does give him incentive to get it fixed fast, doesn't it).

Try some of the stuff I suggested. If that doesn't work, find a good book on radio interference and try some of the stuff in it.

Good luck.

what is the SSB delay?
Is there some need to delay transmitting at the beginning or a need to keep keying the transmitter at the end?

yes,11m is affected by "skip" sunspot cycles more than some other bands.it
depends on wether or not the frequency can be sent back from the atmosphere..a
good reference point for usable "skip freqencies is under 100mhz..hope this
helps...73's

Yes Doug, I do that now. I was not the one originally with the customer service problem, another person was, I was only replying to their post. I had a bad experience with Lakeview employees (owner?) at the 1998 Dayton Hamfest and I will never deal with them again! He was rude and ignorant. The others working behind the table said he was having a "bad day", but he didn't have to take it out on me.

When i was about 12yrs old my older brother wanted to be a cop, so for
christmas he got a scanner which i found myself playing with all the time
(loved to listen to neighbors on cordless phone).One day one of his freinds
brought of a mobile rat shack cb hooked up to a 3-amp supply with the famous $8
"back-of-set antenna" or "hockey stick' antenna....Well he plugged it into the
kitchen table and told me how to use it before he ran out the door leaving me
alone with this radio (tuned into the local home channel).It was pretty much
an instant hobby from there on....its been years and i have been a cb'er ever
since.So how has everyone else in the NG introduced to CB?

Woops,  Looks like someone is getting their feelings hurt.  Or the expressions here are ment to hurt someones feeling.  Not sure.  But remember, some people (small) may be watching this NG so lets try to express ourselves with a little more control over the english language.  You can do it.  Try.

Sorry,  My kids read this newsgroup and I don't like them to hear or see the language.  Hard enough to keep them on the right path you know.

Lets debate some more shall we.

: )

This is necessary when operating SSB because a constant carrier is not present to hold the relay. Without the delay, there would be a lot of chattering when you speak as the amp cuts on and off.

Well, the easiest would be to find an old Radio Shack co-phase kit that they used to sell...

Or just order a 'replacement harness' for one of their existing kits that matches the antenna connections you want to use.

But if you insist...

Use 75 Ohm cable.  RG-59 will work, but it wouldn't hurt to get a better quality than the cheap stuff you usually find.  Measure off two 1/4 wavelength sections.  Now,  1/4 wavelength is NOT 1/4 wavelength in length.  The physical wavelength is the electrical wavelentgh times the 'velocity factor'.   Depending on cable, it can range anywhere from 60% to 90%.  Make up a PL-259 for you radio end with the two cables 'in parallel', and put on the appropriate connector for what you want to do at the antenna ends.

When you tune (if necessary) antennas like this, it's usually easiest
if you use a straight piece of 50ohm coax to tune each one first, to
get them close by themselves, then hook them up together through
the co-phase harness and check again.

Mike

I'm just beginning my trek into learning Morse,
but the _random_ letters seems to be a key.

Learning the phonetic alphabet is pretty easy.
(Alpha, bravo, charlie...) but to use it effectively
you need to be able to do random letters.

I use automobile license plates as practice -
they give a pretty 'random' pattern.

This could probably be adapted to learning
Morse code as well.

Bryan

Had an inspection in Feb. 1980 to my Ham Station due to Cable TV People
saying I was "cutting up" Channel 18 (144-148mhz) (also HBO down here)
so the FCC checked me out and the cable co!  I was clean and the cable
co was leaky and had to fix their leaks or risk getting shut down for
intereference to Aircraft users, Marine and Ham.   Their biggie was and
is illegal freq use with CB and Amps down on the list.  They will
investigate if you make a nuisance out of yourself.  Excellent
professionals but serious in their work and I have made it a special
note to keep on very good terms with FCC, learned alot from these guys
(local FCC guy in NOLA is a ham and very active).

Piero:
Let me just say that if you want customer service, go with Larsen. Yes
they will cost a little more up front, and they might not look as
sleek as some, but you can't beat the warranty. 3 years. One time I
called them and said I had a probem with a dual band rubber duck, they
sent me a new one and said just destroy the old one, no questions.
Another time I had a coil on a 5 year old antenna crack (yes, I told
them I did not have a receipt and it was 5 years old), they still
replaced it free. Larsen has great customer service.

Petition for Rulemaking
In the Matter of

Amendment of Section 95.413(a)(9) CB Rule 13
Prohibition of Communications or Attempts to
Communicate with Citizens Band Stations
More Than 250 Kilometers (155.3 Miles) Away.

Petition for Regulatory Relief of Burdensome
And Unnecessary Rule that Inhibits the Public's
Simple and Unencumbered Access to this
Communications Service.

GREETINGS:

SUMMARY

Although Subpart D Citizens Band (CB) radio is intended as a short range communications service1, users should not have to concern themselves with the possibility of inadvertently contacting another CB station farther than presently permitted by rule. Further, CB operators should not be constrained from contacting distant CB stations in order to facilitate communications necessary for personal convenience, navigation, traveler assistance, and least of all emergencies and disaster communications.

The propagation characteristics of frequencies surrounding the 11-meter band are well understood to be capricious2 and, in as far as the average consumer is concerned, unpredictable. Utilizing a consumer device such as a CB radio should be a simple and unencumbered process. A user should need only to exercise common sense and courtesy, not posses a technical understanding of High Frequency (HF) radio wave propagation, nor a regional geographic frame of reference limited to an arbitrary radius.

DISCUSSION

Whereas; the Federal Communications Commission (Commission) has objectively stated that unnecessary and burdensome regulations should be eliminated or streamlined3.

Whereas; the CB Radio Service is intended primarily for use by consumers and small entities4, rather than by trained or licensed operators or technicians.

Whereas; in spite of sporadic communications that do occur beyond the existing 155.3 mile limit, such communications will not substantially alter the primary use of CB as a short range communications service. This has been well evidenced for decades, particularly through and during the previous and present 11 year solar cycle peaks. Such long distance (DX) communications can and do occur on a frequent basis, with or without the knowledge of the operators involved. Such DX

communications have not materially affected the given short distance purpose use of the CB Radio Service, as demonstrated by the functional, actual everyday use of short distance CB radio communications by such entities as over-the-road truckers, automobiles travelling in groups or caravans, and neighborhood watch groups. Admittedly, there are times when communications from distant stations do interfere with local communications. This occurs however, whether the distant interfering station is communicating with a local station, with respect to the station being interfered with, or with another distant station. There is little operational control that can be exercised by any party in this example, except common courtesy under existing CB radio traffic rules relating to permitted communications and priority of traffic.

Whereas; nothing in this petition seeks to permit the operation of other than presently type accepted or certified CB radio equipment. This petition does not in any way seek higher authorized transmitted power output levels or expanded operating frequencies or any sort of refarmed channelization plan. Additionally, nothing in this petition seeks to change or add to existing modes of communication presently authorized in the CB Radio Service.

Whereas; CB communications utilizing authorized 12 watt Single Sideband (SSB) mode are more likely than 4 watt Amplitude Modulated (AM) signals to travel longer distances by means of ionospheric reflection (skip)5. Additionally, these higher power SSB signals are more likely to travel greater distances as ground waves as well6. Therefore, it is even more difficult for SSB mode users to determine the range of their communications without actually first establishing an errant DX contact.

Whereas; emergency communications should never be subject to any law, rule, or regulation inhibiting the immediate transport of such message to any station in a position to render aid or to forward such message.

Whereas; disaster relief communications, including tactical relief logistics, health and welfare traffic, and point-to-point communications between and among relief and public safety agencies, organizations, and individuals need not be restricted from making maximum use of the low cost and ease of deployment of CB radio equipment to mitigate the effects of such disaster.

Whereas; motorists and other travelers need simple access to their CB communications without regard to having to assess their immediate location in reference to other potentially distant stations. This is particularly true for motorists who are presently required to know not only their instantaneous location, but also potential distances of stations contacted. The present rules require such traveler to figure a dynamic regional geography extending well beyond 155.3 miles, in order to avoid fear of running afoul of this regulation simply by keying the microphone and contacting the "wrong" station. Relief of the distance of communications limitation will enhance driver safety by allowing CB operators, while driving, to complete their communications promptly and thereby devote more attention to the operation of the vehicle.

Whereas; CB calls and communications for the purpose of determining the utility and operational ability of legally authorized CB station equipment and antenna systems should be unencumbered of distance limitations. Such relief will enhance the value of such test calls and communications, and establish operator confidence in both the reliability and limitations of the band and such CB station equipment. Such on-air testing including DX calling would not materially disrupt the existing, ongoing, purposed, and predominantly de facto use of the CB Radio Service as primarily a short distance communications service. Again, this scenario has been well evidenced for decades, particularly through and during the previous and present solar cycles. And still again, such DX communications have not materially affected the given short distance purpose use of the CB Radio Service, demonstrated by the functional, actual everyday use of short distance CB radio communications by such entities as over-the-road truckers, automobiles travelling in groups or caravans, and neighborhood watch groups.

Whereas; the absence of the 155.3 mile CB communications limit will serve to relieve FCC enforcement personnel of a portion of their workload, freeing such resources for more important enforcement issues such as dealing with cases of patent abuse of the band including malicious interference, profaning, and music broadcasting.

Whereas; until contact with another CB station is actually commenced, the calling CB operator has no way of knowing if the station contacted lies within or without the presently authorized 155.3 mile radius! Thus, inadvertent and otherwise innocent violations of the 155.3-mile distance limitation do occur. Consumers must be protected from this unreasonable, unnecessary, ineffective, and no longer useful regulatory burden.

SEEKING

Now therefore; this petition seeks regulatory relief by these means:

1.) Immediate repeal of 47 CFR �95.413(a)(9) found within CB Rule 13, herein paraphrased: "You must not use a CB station-- � To communicate with, or attempt to communicate with, any CB station more than 250 kilometers (155.3 miles) away;"

2.) Modification of 47 CFR �95.413(a)(11) found within CB rule 13, herein paraphrased: "You must not use a CB station-- � To communicate with stations in other countries, except General Radio Service stations in Canada;". This section should be modified to permit communications with stations in other countries, subject to any restrictions or exclusions that may be imposed by either the International Radio Regulations of the International Telecommunications Union, or of the government of any country affected so by. In any event, unrestricted distance of CB communications must be allowed within or over any area of the world where radio services are regulated by the FCC, including within the territorial limits of:
The fifty United States.
The District of Columbia.
Commonwealth of Puerto Rico.
The Caribbean Insular areas under the jurisdiction of the FCC.
The Pacific Insular areas under the jurisdiction of the FCC.
Any other area of the world, except within the territorial limits of areas where radio

services are regulated by-- An agency of the United States other than the FCC. (Subject to its rules.) Any foreign government. (Subject to its rules.) An aircraft or ship, with the permission of the captain, within or over any area of the world where radio services are regulated by the FCC or upon or over international waters. You must operate your CB station according to any applicable treaty to which the United States is a party7.

The present authorization to communicate with said Canadian stations must continue to be embraced. Further, any rule change relative to this petition must clarify that such communications with Canadian stations is always permitted, any extant distance of communications restriction notwithstanding, whether or not such had been the original intent of �95.413(a)(11).

3.) Modification of 47 CFR �95.418(b) found within CB rule 18, herein paraphrased: "How do I use my CB station in an emergency or to assist a traveler? � When you are directly participating in emergency communications, you do not have to comply with the rule about the length of transmissions � You must obey all other rules." The statement "You must obey all other rules." is unnecessary, must be stricken, and language inserted that adds in essence, "You do not have to comply with any rule about communicating with or attempting to communicate with any CB station more than any specified distance away." This change is necessary to expedite response of emergency services in an emergency, so as not to further endanger life safety or property.

4.) Modification of 47 CFR �95.418(c) found within CB rule 18, herein paraphrased: "How do I use my CB station in an emergency or to assist a traveler? � You may use your CB station for communications necessary to assist a traveler to reach a destination or to receive necessary services. When you are using your CB station to assist a traveler, you do not have to obey the rule about length of transmissions � You must obey all other rules." The statement "You must obey all other

rules." is
unnecessary, must be stricken, and language inserted that adds in
essence, "You
do not have to comply with any rule about communicating with or
attempting to
communicate with any CB station more than any specified distance away."
This
change is necessary to expedite information of necessity or convenience
to motorists
and other travelers.

The proposed rule changes herein are clearly in the interest of the
public interest,
convenience, and necessity and appropriate to the new deregulatory
momentum8 of
the Commission. Your careful and prompt consideration is greatly
appreciated.

Well, I got it up and I used the clamp- it seems to be sturdy enough. It
also works great. I can't compare it to any other antennas I have had
because they were setup at a different house and in a totally different
way.
```

73s

Mudpuppy

start at the root of the problem, your radio set up.  Then work your way forward.  Buy your neibor a filter.

KRS

We used to put the 6KD6 and 8950s in the Trams, Brownings and Daks in the 80s....

150 watts from the radio drove the Drake L4Bs and SB220s very nicely!

Plate Modulated and all!

Yes, your right.

However, I have a Texas Star modulator that more than makes up for it!  hehe
;-)

No.

I offered him a free internet connection (via my ISP) and a free computer and he didn't want it.

Home is his place away from the internet, and he has found that you make a lot more money when you spend the free time in the shop, rather than typing on the old keyboard!

Someone needs to introduce Dominator to the MRF421.

Then you would use a 1 driven 2 driven 4 driven 6 driven 8 driven 12 driven
16 driven 24 driven 32, and STILL wouldn't overdrive a thing!

I have them burned to CD, on MP3 and also RA.

Don't ask for them via MP3 or RA, though.  I told him that I wouldn't
distribute them.  Sorry.

How close are the intercoms to the mic base unit? Try to
separate the two.

It means that higher the wattage the more power it can handle. an antenna rated at 50w,you wouldn't put 100w into it.because it would burn out and short out and  blow up your radio or amp.   x-ray 512

We want to put two firesticks on my son's pickup up by the cab in the stake holes...

What kind of coax and what length must the cable be for the proper phasing...and do the two pieces connect with a coax-T and then into the radio with a special length cable...

Been many years since I did this and the old brain just ain't the same...

thanks...

please respond by e-mail as I only get to the newsgroups once a week or so...

That will end up in the hands of a truck driver.

Not knocking them, but it always seems that the bastard CB radios end up in a JB Hunt or Swift truck.

Once the drivers get a little bit of experience, they sell the radio to another Swift driver (this is at the same time they have the intrinsync 2 years of experience, so they are moving on to another company) and purchase a new Galaxy or RCI radio.

Just like clockwork.

  Use two 17 to 18 foot pieces of 75 ohm cable to feed each antenna.
Use a convenient length of 50 ohms cable between the radio and the T
connector.

Or, get a Cobra 135..

They used two completely separate output sections...

One, Class AB with no regulation for SSB (B+ direct to the input B+ line), and another transformer driven final circuit for the AM transmitter!

> like their AM-only Counterparts. T1 is an RF choke to keep put RF and
> engine/power supply noise from the Audio chip [IC6] power supply line

> and smooth out ripple and wine while powering the finals - thats why it's so large, it's got a lot more current on it than the MB3756 regulator IC chip.
>
> You might be getting this confused with the method of using a "Modulation Transformer" to generate the proper drive and impedance to work into the collectors of the Final and Driver in an AM only radio.
>
> The 148/Grant AM audio output of the audio chip is driven into a power amp designed to act like a switch, and a linear amplifier at the same time while in AM mode.
>
> When SSB is enabled, no audio power goes to the AM regulator, instead it's turned on like a switch and supplys full voltage to the Driver/Final.
>
> This part is the AM regulator - and is used for CB radios with AM/SSB together. Works similar in function as a Modulation Transformer, but provides DC power, and Audio Amplification - as well as bias to drive the Driver and Final all while in the AM mode.
>
> This is one of the failings of SSB type chassis like the 148 and Grant styles.
>
> The AM only radios use a Modulation Transformer that can develop higher voltages without having current regulation. It can flat out-do an SSB radio in modulation and swing drive. Merely by using the Transformer in a fashion to supply current for heavy drive, and the voltage rise to help the collectors of the Final and Driver provide the boost needed to make AM-only radios so stellar in performance if properly "soop-ed up" right.
>
> In an SSB radio, to keep things stable, they use regulation, both voltage and current are controlled to keep things tame...which limits modulation to a point, but the joy of having one of these radios is to combine more power into an audio Sideband, that the AM radios cannot do.
>
> SSB radios use low-level modulation when in SSB mode. The term "low-level" is because of where it starts at. It's at the pre-driver mixer stage of the RF TX amp section, where carrier and Audio are mixed together and the carrier is filtered out, leaving audio - to be amplified in the subsequent stages. And is why in SSB mode, the Driver and Final get steady DC, with no audio - it's not needed nor is it desired, it's already been mixed to the right frequency and anything added to it causes problems.
>
> I hope this helps explain why T1 is not the Audio Transformer - it's an RF choke designed to filter the power supply to the Audio Amp and Final/Driver.
>
> So, if you're really looking for SWING, an AM/SSB radio is not the ticket to stardom. Use an older AM-only radio for the best results.

I was told by a very good source that Toshiba's Q.C. is very stringent and that very few transistors ever need to be matched. They check the match anyway for public appeal and sales ploy.

Is this modification still being performed, and can it be done to my D201A?
That would make one less piece of equipment in cascade..

You can't go wrong with a Wilson 1000 Mag mount. Wattage is the max power handling of the antenna. Your stock 510 only does about 4-5 watts.

How do I construct a phasing harness to run two firesticks on my son's
pickup truck...

What kind of coax??? What is their length??? Do I use a coax T to join them to the run into the raadio??

Any help would be appreciated as it has been long time since I did this and the old brain just ain't the same...

Please respond with e-mail as I don't get to the NG very often...

thanks...cleve

No.  That would be no change at all in reality.  I meant that he had changed
components, part values, tuning of the circuit, etc...  Not just make
something LOOK different.  Sean
>
prozac 625 wrote in message ...
When some one says small changes are they talking about replacing a 50 Ohm
resistor with the 100 Ohms in parallel? Or do they just relocate the
position of the components?

Don't waste your money and time.  Use a single and forget about the looks.
Performance is what counts.  The antennas are WAY too close to work
properly.  Sean

go down to your local truckstop and buy an already made up harness, they come in both 12 and 18 foot versions, I paid about 12 bucks for my last one , they do look cool , but for total performance need to be 8 feet apart , on a pickup one ant. works just as well , we put 2 on big trucks , because they help cut down on the darned thing being so directional because of the large metal trailers we pull .

Yes.

A system that is not power starved will ALWAYS sound better than one that
is!

And, the watts will be REAL, rather than the harmonics put out by a system
being starved.

Toll Free

I guess the best way to know if your system isnt starved is if it doesnt
lose volts under load....

The best way I can suggest to learn morse code is got
go to
http:\\www.cq2k.com

and buy the tape set. I went from no morse code to passing the 20wpm test in a year. I passed 13wpm in a month.

The method seems silly, but it works.

Just a happy customer.

Carl

Lower bands in the 10 to 20 Mhz range are more affected by the sunspot cycle than the 11 M band. During minimum years there is still E-layer skip that is not affected asa much by sunspots. F layer propagation is almost always controlled by sunspot activity.

If the phone is a corded type phone there are kits that can be installed to eliminate this problem. Yout loacal phone company may reccomnd a service shop that can fix it. What is most likely happening is a rectificatoin of the CB signal in the handset portion. Sometimes a .01 uF cap across the speaker will eliminate the problem

Greetings!

While 11M [CB radio band] is involved with Skip propagation, it's kinda' hard to figure out what you mean by "other band"?

Theres a lot more CB's out there, than any other radio type I know of.

An interesting thing to think about, is called Maximum Usable Frequency, or MUF.

The sun goes thru a periodic cycle of sunspot activity, or when sunspots appear on the solar disk. These "spots" can be viewed using indirect methods to display the disk onto a larger surface like a projector. Or using special filters, you can see details around them.

This cycle have a peak, "maxima", and a lull, or "minima". This cycle takes 11 years to complete. We are currently into year #4 of this cycle.

When sunspot activity is high, the MUF is higher.

Meaning, that during low sunspot activity, when the sun is quiet, or at a "minima", the Skip Propagation level is pretty low. Compared to what is occuring now, called "maxima", the Skip Propagation level is high.

Sunspots interaction with the upper atmosphere changes the MUF available. More solar activity, usually equates to a high MUF.

But not always, sometimes those sunspots can be *very* active and cause disuptions, or when it's no longer a skip phenomenon, it's a literal blasting away of our ionosphere. This occurs when the Earths Magnetosphere [the earths own magnetic field surrounding the earth and our upper atmosphere and beyond the orbit of the moon that also helps confine electrical charges like ions have] is bombarded by solar radiation emmanating from the sun ranging from plasma to X-rays generated by solar activity in or around sunspots. When this occurs, the ionosphere, responsible for the skip you hear during the day - dissapates or or pushed back away from the sun.

Disruptions on a global scale occur when the Magnetosphere that faces towards the sun, cannot shield the ionosphere from this radiation. Both are "pushed back" away from the earths sun-lit side and towards the earths shadowed side. We've then lost the mechanisms that makes skip propagation possible.

Not to worry though, the ionosphere is very, very close to a near vacuum and is easily affected by sunlight and the pressure from solar wind. So, us down here have little to worry about. However, some power disruptions and radio "blackouts" will be the highlight of the day due to the intensity of electrical stength these storms have. And you might get to see some very unusual Auroral displays that are nomally found in higher lattitudes, into the tropical lattitudes closer to the equator.

When the sun is quiet, the MUF is low, like in the 20M band or longer wavelengths. When the sun is active, the MUF can commonly go up towards the 6M and even into the 2M band in VERY rare occasions.

While Dancing with the Mouse on Fri, 10 Dec 1999 04:40:27 -0000, the Modem interrupted with an MNI from ""Darkside" <me@dakside-of-the-moon.co.uk>", and the MotherBoard buffered this to Video RAM:

:+> Is the 11M band connected more to the sunspot cycle than other band?
:+>
:+> darkside
:+>
:+> P.S. I hope I worded that so it dosent sound to dumb;-)
:+>
:+>

```
Regards!

This radio is made by Ranger.  It is the same radio as the RCI 2960F.  This
radio has the new improved circuit boad like the Connex 4800 and Cobra 148
GTL-DX, but with 100 watts added to it.

There are several ways. The best way is to learn each character at 18-20wpm. Once you know them at that speed it's a cakewalk. If you start at 5wpm you'll have a HELL of a time getting the speed up. There are several programs to learn the code, I like Supermorse. Do a web search for it or check out:

http://www.ac6v.com/

That site has links to EVERYTHING!

Tom

I leaned the Alphabet not the phonetic Alpha, bravo shit. I know A = ._ B=
_111 C= _._. D=_.. E = . F= .._. I think you get the point but The point is
that I only know the letters in that order not random.

I have Down Loaded a cool program and I'm off to a good start.

|   If you LEARNED the phonetic alphabet you already have gotten off on
| the wrong foot.I have seen people try to memorize the phonetics and this
| is ridiculous,its much easier,simpler and more effective than
| that....When you here the phonetic for "A" for
| example(alpha,america,etc.)just start writing the word and stop after
| the first letter! Thinking about what letter is meant by a particular
| word takes a fraction of a second longer.It was never meant to be
| something to be memorized or learned,but a new way to use something you
| already know.The ARRL and others do a mis-servise by printing the
| phonetic alphabet but what would you expect from a bunch of no-coders?

A good amp will run on 12-20 Volts. Will put out a shit load more then you put into it. A good amp does not necessarily mean an amp with over night devlerery or an amp with a pretty Casing (especially if there is no fans in it).

"Gary Danaher" <gdanaher@flash.net> wrote in message

That's very interesting. I don't remember anything in this thread about 2 meter HT's and their modification, however.

No.  [ I do wish people would look for previous posts;  this and many other questions have been answered multiple times on this or the  rec.radio.equipment   newsgroup.]

The HTX10 is a fine little rig:  however, it is designed solely for use by licensed hams on the 10M (29.0 - 29.7MHz) ham band only.

On the HTX10, the PLL and CPU are combined so PLL control is all within a single chip under program control.  Since it is a high-speed PLL, there is also no need for any "offset mixer" scheme, thus closing down another possible modification path.  Changing of other crystals will just mangle the radio - these freqs are tied in with the IF frequencies, filters, etc., which can't be moved.

Don't wanna "turn up" the power either - this rig runs around 30W
FM/SSB(PEP), which is near the max rated performance of the final
transistors.

A so-called "swing" mod would be senseless too as most reports are
that the mic gain really has to be throttled back to midrange for
good quality transmit audio.

 ""Van C. Bagnol" wrote:
 ">
 "> Do FM wireless mikes interfere with either cellphones or 49 MHz intercoms?

One intercom was at the back of the audience stationed close to the sound
console, where I assume the base units were, but the intercom was on
push-to-talk, not VOX, and there didn't seem to be a correlation between
Tx'ing and the buzzes. Other other intercoms were scattered in the rafters
manning the spotlights, about 50 feet and more from the base units. The
mikes themselves were at the front of the pews and perhaps 75 feet from
the base units and all intercoms.

Hello big world,

Jon Foster <therealms@att.net> wrote:
> I'll take this vote. I'm sick of the "fear of the crash". I have to deal
> with this stuff every day at work.

I'm no doctor, but I did work at a fancy resort on a island and I'd say you need to take a little breather.  We're like rubber bands you know, and some of life's challenges streatch us a little more than others.  The trick is to streatch back to our regular selves at the end of the day.

Taking a break thruogh the day helps... lots of solutions available.  I personally wear my goofy fishing hat to remind myself who I really am.

None of this will help if you have problems at home... add a little Love at home if needed.

Oh, lest I forget... we have something for your bloodshot eyes, sore back, and battered mind.  Take a breather, relax back in your chair and please visit our little stress-free oaisis on the net at www.cobol-man.com  Tell a friend:)

We can make a difference,
RB

Thanks for answering my question on radios. I have one more question about a LA 900 amp.
Bought  the LA 900 from a friend who needed money. It has never been used.. Is this a good amp? Is it high drive or low drive? How many amps does it draw to operate, and what is the little red light on the front right side for.( It says Heat)..If I use this and it needs service, is there someone who works on these? Thanks Alan

What have you done different lately?

Try a new cable between the guitar and amp.

Make sure all screws and bolts (on connectors) are tight.

You can get away with a little as 54 inches between antennae for phasing.
Depending on the phase shift between them will affect directionality.

I have a Powerline 100 bilinear power amp. I have never used it and only
know that it lights up when power is put to it. It has buttons for
preamp , power and SSB and an unlabled toggle switch on the front panel.
Let me know if you are interested.
PS: Not legal for use on "class D citizens radio "

Agreed again ...

I'd want somewone to let me know that my rig had a chirp. I don't quite understand why he would run a rig knowing that, and not attempt to fix the problem. To each their own, I guess.

Great dream but it wouldn't work because of the thousands of CBers who not only would ignore this rule but go out of thier way to break it.

The amp has always had this problem (I don't use it that often)--but only at my house. It doesn't seem to have this problem when I use it elsewhere--i.e. locations where there aren't powerful AM transmitters nearby!

I have tried different guitar cables but I never thought about checking for loose hardware--I'll do that. Thanks.

The interference is basically an AM radio broadcast that can be heard coming from the speaker of my amp quite loudly! I do live within a mile from an AM radio station/transmitter, but haven't experienced too much interference in the past, and none of my tube guitar amplifiers seem to have the problem.
> >
> > I've tried a radio shack RF filter for the AC power line, but this didn't help. A guy at raio shack suggested building a "Farraday Cage" into the cabinet of the amp--i.e. line the cabinet with tin file or wire mesh--but I was hoping for an easier solution. Can I use some sort of RF filter on the speaker wires? Any ideas would be greatly appreciated.

The RS filters were probably the wrong material for the freqs you need to control,try Amidon and put some of thier ferrites on the AC cord and the guitar cord.

In response to my post, jeffherrings@CUThotmail.com (Hank=A0Aaron) wrote:

Just out of curiosity... Why use QRM? Something like "static" (or something else understandable to all) would work.... I'm not bitchin'... just some do not know their Q code... though, I think it would be beneficial... but that is a whole OTHER thread... <grin>

The Q codes are well known both in amateur and maritime radio work.  In fact, some police department use them instead of a 10 code.  I just assumed that in a radio group QRM would be well understood.

Perhaps I should have explained that the on and off switching of the mechanical flasher in the Christmas lights produced radio interference that was detected and amplified by the radio circuits and became audible noise in the receiver, heard as popping and cracking.  But, then again, that might be too technical for some to comprehend.

Now, have we wasted enough bandwith with this?

MC 10kW Jesus wrote in message <3852B6CF.C781AE51@hotmail.com>...
:If you consider that a 100% modulated AM carrier is drawing about 3.5A then
a
:2W "swinging" to 40W should be drawing close to 35A.
:
:I don't think I need to tell you it ain't.
:
:MC

Just curious... You say 40W should draw 35A?  Im sure you are exagerating to get a point across...aren't you?

Let me know... I may just be wrong here... Take care.

Hank

:
:You just have to look at the current meter on a bench supply to see that
there
:is nothing inherently "30W" about a "swinging" AM signal on this radio.

I own the Cobra version of this radio and just love it. Everything i've
heard points to the fact that they are identical radios (aside from the
name on the front.)

If you want information on the radio, including mods, specs, the works,

```
pay a visit to my CB Page (link below.)  It's all there!

Took in a Uniden SPU-416KT 16 channel UHF 4 watt HT in trade.  I have no
need for UHF.  Would like to trade for  VHF or 2 meter HT, SSB cb/10
meter rig, volunteer fire light-bar, or make offer.

Radio seems to be in good condition, Three channels programmed, one
repeater and two simplex.  Battery holds charge.  I don't have the
charger for this radio.  Great for GMRS, business, or high power FRS
radio. (FRS not legal or advisable)

E-mail replies appreciated.

Good Thoughts, but how do we stop ops from running too much power,
bleeding over, and ignoring every rule?  Until we can get something done
on the existing rules, why add any more than the FCC can enforce.

So, nobody can tell when you volt up and your watts go down?

Guess your right....  You don't see any harmonics.

I dont know Jim.  Have we?  If you wish to be a smart ass about it, Im sure we could keep this going for shits and giggles.  My post was just to inform you (more so than anything else) that some DO NOT know the Q codes..  Then I continued on by explaining what QRM was, within my suggestion to you.  But hey... I offended you... GET OVER IT! Also Jim, watch what you assume.... you know what is said about assumptions.....

Jim/Joe, its all the same.

Jim, W8EMS/9 wrote in message
<12308-3852D10D-327@storefull-126.bryant.webtv.net>...
In response to my post, jeffherrings@CUThotmail.com (Hank Aaron)
wrote:

Just out of curiosity... Why use QRM? Something like "static" (or something else understandable to all) would work.... I'm not bitchin'... just some do not know their Q code... though, I think it would be beneficial... but that is a whole OTHER thread... <grin>

The Q codes are well known both in amateur and maritime radio work.  In fact, some police department use them instead of a 10 code.  I just assumed that in a radio group QRM would be well understood.

Perhaps I should have explained that the on and off switching of the mechanical flasher in the Christmas lights produced radio interference that was detected and amplified by the radio circuits and became audible noise in the receiver, heard as popping and cracking.  But, then again, that might be too technical for some to comprehend.

Now, have we wasted enough bandwith with this?

You dont have a problem with this though, Im sure....  Considering you hang
out on alt.radio.pirate?  Just curious is all.... but you are correct...
just out of spite not to mention, ignorance, this rule would be more than
just ignored.

|  Great dream but it wouldn't work because of the thousands of CBers who
|not only would ignore this rule but go out of thier way to break it.

Are there any known mods for the TRC-232 hand-held cb?  I have an old one and would like to see what it will do.

Heard a guy on the radio the other day talking about a mobile antenna called a Quad Rod by Solarcon and it being able to outperform the Wilson 1000. Anyone know anything about the Quad Rod? Thanks.

The RF is being rectified by a semiconductor junction. The amplifier is then amplifying the rectified signal. The fact that you said it is "quite loud" indicates it is most likely getting in at the input stage. Ferrites will be somewhat useless for AM, (.54 to 1.6MHz), you would be lucky to get 100 ohms from a ferrite at those frequencies. You could try a ceramic cap at the input ( few hundred pf) but I suspect that the amp already has one

already. The best way, and likely the only way is to find the
amplifier stage that is causing the problem and bypassing the
RF there.

Texas Star is very good about getting the schematics out to the masses.

They are also very good at customer service, going way beyond the call of duty.

They also run very well, and usually do a hell of a lot more than they state.  I don't ever recall seeing one do what was printed on it, they always did more.

However, they are not a balls to the wall amplifier.  They are designed to run at 14.5 volts... Some can get 15 volts on them and they last.  If you want to run volts, you must fiddle with the output capacitance and the bias circuit, since the bias is derived from a simple voltage divider / clamp, when the volts go up, so does the supplied bias current.

I have also been supplied with all the schematics for the Palomar amps over the years.

Messengers have been a bitch to get, but I have a small collection of the originals (nothing like the ones produced today, though, so if you have one, I don't have a schematic for it).

Usually the mass produced boxes will provide a schematic (ALL Texas Stars shipped with one that I have EVER seen), and the manufacturer will allow your distributor to order one if you need it.

The only companies that I have really been unlucky getting a schematic for
are the "battle box" amps, although I did get some from Cookie.

Toll Free

Haha, the latest method of "hands-free" operation! Just make sure the
device is properly grounded so you don't get RF up the butt! I guess you
would call it BOX, Butt Operated Xmit. You could write an article complete
with schematics for QST. Maybe design one that operates on 12VDC for mobile
operation!

So, in an emergency situation, I would rather have that than a CB. I know that the state police in Indiana monitors or at least used to monitor ch 9. However, unless you have a good set up power/antenna wise, it will be useless. I am not a sales person, but since I live in a part of the the contry that is somewhat flat, cell phones work in most parts of the state. Someone who really wants a cell phone only for emergencies should invest in a bag phone, they are stronger signal. I am going to get an adaptor to for my handheld so I can put an antenna on my car to make sure I can get a signal almost anywhere. Your right about that tumor thing, but usually those are the people that are sales people that talk on them 24/7. Besides, cops have 800 mhz radios, most have the small shoulder mic with a small antenna. I have not heard any reports that these cause tumors---yet. Since its the same band, I am wondering if cities are keeping it hush hush so they don't have to go back to 155 or 400 mhz, or if its just reporters tring to stir up news about cell phones. Something has got to give. They (police radios/cell phones) should cause the same symptomes. Oh yea, officers usually have their radios on 8 hrs straight.

>
> Dave
> "Sandbagger"

Not really.  See most of the cig suits have been found in favor of the cig company.  Cell phone companies will be safe as long as the FCC says their products are safe.  A couple of cig companies had some documentation that was found where they were uping the nicotine levels on purpose.  Another company was found to be advertising to minors in thier inner office memos. Cell phones are different.  If you one of those "Look at me, I am on a cell phone" type, no one made you use it 24/7.  Besides, like i posted before. It seem strange to me how no cops have gotten these brain tumors from using 800 mhz radios which are close to cell bands.  I am sure if there was a case, many cities would lose money switching back to the vhf freq, so I can see a possible "sweep it under the run" mentality.  If you or anyone knows of a case please let me know.  Officers have these shoulder mics with small antennas near their heads 8+ hours a day.

I do think that cell phones are the cause of some emergencies.  Its kinda odd that I may use one to call in an accident which could have very well been caused by someone on a phone.  I heard that Indiana is going to reprint their crash forms with the option for the officer to put "Using cell phone" as a contributing factor.  This could cause many laws, etc to be passed as well as some law suits like that of the gun industry.  Just my opinions,
ryan

HERE IS MY NICKEL TOSS ME 3 CENTS BACK!

You need to take some pictures of your amps.
I think your set up will win nicest looking set up but that isn't very
convenient for comp use. I prefer easy access to my stuff with out digging
through Plexiglas and stuff. I'm more concerned with performance over looks.

Perhaps you also remember the letter you got telling you that your call sign was being re-issued.

Seems like somebody at FCC slipped up big time.  There was a protest from other nations.

The first complaint came from Cyprus over calls like 5B2056. These call signs are assigned to ships registered in that country. Other countries followed with complaints of their own.

The radio may be on, but no signal comes out unless the PTT is pressed.
My cell phone xmits whenever it's "in use". Big difference!

Been there done that - got the TVI to prove it!  :->

> It seems to me that the audio used to modulate the radio would

Yes, 3.4kHz is about the highest you ever need to go. Especially
considering that your typical CBer is a male whose voice is not going to
have much audio information above 2kHz anyway.

This was e-mailed to me from AES a few days ago....
             New. And the Band is hot!
Ranger RCI-2950DX 12/10M Transceiver
An old favorite now updated with an improved receiver, double FET
balanced mixer, surface mount components and improved display lighting.
Operate local communications as well as frequent worldwide DX, base or
mobile. Participate in club events, emergency communications and more!
The unit covers 24.800-24.9900 and 28.0-29.6999MHz with an RF output of
25W on SSB and 10W on CW/AM/FM. The RCI-2950DX also features auto SWR
monitor, receiver clarifier, noise blanker/ANL and programmable repeater
offset. The unit has a large frequency display with dimmer and an active
frequency scanner with 10 programmable frequencies. A frequency selector
lockout and PA feature are also included. $249.95

Copper is backordered until sometime in January, and thats only if they
get the manufacturer to make some mods to it to get the FCC off their
back.

if you read enforsement updates in the ARRL online letter you will see
actions every month against hams,cbers and others,enforcement has picked
up a lot in the last year.

Looks and acts like an RCI 2950 but the freq range when modified is
shifted slightly so you get the entire 10 and 12 meter bands,preferable
for amateurs over the spectrum the RCI provides that they can't legally
use.
  Lots of quality problems with the ones I have sold compared to the
RCI.

CBers in general won't pay for quality or extras,most CBs sold are the cheaper AM only models,Kenwood won't make crap.

No much use, but where I live there is an alternator rebuild shop 'round the corner that does custom work. If you speak a few words of Arabic to 'em the price drops even lower. :->  Their prices are excellent. My point? Check your local yellow pages - you might be pleasantly surprised.

Tested this one. It's good. The Grant XL is more selective and every bit as sensitive. Of course, the GrantXL isn't a 10/11m radidio. Someone mentioned the old Grant. I'll agree here too. I think you'll find that single conversion SSB receivers are superior to dual or triple. Once again, more isn't necessarily better.

Next time I visit the US I'm going to take a college course in American
English as a foreign language!

When I read the mail on 6 I have to act as translator to anyone in the
shack but sometimes even I have problems.
>>       http://www.linearampuk.u-net.com/
Of course we can run tubes (we call them thermionic valves) as long as
you have a ham (amateur radio) license.

We are allowed 26dBw (400w pep to you and me) with a full license. I'm
aware you can power up to 1500 on the ham bands.

More if you live in CA and operate on 75m:-)

Phil / UK

It is the PLL that locks, not the VCO. Sorry to split hairs here but I've designed many a PLL circuit. I'll be up front and say I've never modified an HR2510/2600 with the Chipswitch myself, but I would suspect the best way to attack this is with some kind of switched line that changes state at the low end of the band. This can be used to alter the frequency spread of the VCO. (old Motorola trick here). I'm thinking here about an additional capacitor that is pulled low through an open-collector transistor. The base of the transistor is attached to the line that changes state (I suspect there is one in there somewhere) via a 8k8 resistor.  This way the capacitor is at high impedance normally and goes low. I've seen wideband radios that have two of these circuits that are switched in and out to expand the range. (2 of these give you four bands of tuning for the VCO).

Uniden has that market tied, wrapped and shipped!

Uniden does make professional two-way products, but in my opinion they are bottom-shelf compared to the likes of Ericcson, Motorola and pretty much all others.

The Short Answer:

Replace your guitar cable(s). A musical instrument cable is constructed -differently- than a regular ol' 1/4" phone patch cord. It has two conductors surrounded by a third. One is the "tip" or hot lead (center pin of plug), the next is the "ring" or ground and the third is a braided jacket surrounding them. The way the cable is wired is as follows.

Amplifier end: Red (or clear) to tip, Black and Shield to ring
Instrument end: Red (or clear) to tip, Black to ring, shield floating free <--- very important!!

Make sure that you use the cable the "right" way round. Professional cables are usually have ends marked "instrument" and "amplifier" or an arrow indicating direction. This is particularly important if you are playing live.

AM radio stations can only get into the amplifier if there is a means of rectification. What the devil does that mean? Well, there must be a non-linear junction somewhere in the path. Typically, amplifiers themselves do not have these non-linear junctions. What is happening is that your 1/4" plugs (and possibly sockets) are dirty and/or worn. These less-than-perfect

connections, with invariably different types of metal, are performing the
function of a diode which is rectifying the AM broadcast signal and
demodulating it.

Try cleanin' 'em up and you'll be amazed.

If your running a lot of SSB, you'll need a box with bias in it.  This keeps the box more linear and stable, producing less in-band splatter ( IMD ).

Since your running this in a big truck, i would HIGHLY suggest investing in a better antenna system instead of mega-wattage.  While the increased power will surely help out your TX capabilities, a better antenna would do that AND improve your RX at the same time.  This is not to mention that you'll have FAR  less problems with the puter in the truck by making the system more efficient with less power.  Not only can the RF play games with the puter, but the huge surges of current can also whack things up.

I have found that a strong radio and well built two pill when matched with a well tuned and grounded antenna system will devastate FAR bigger systems that are not properly installed.  I have sat side by side with a two pill and keyed on a guy running a 2 x 8 box.  His antenna was also physically longer and higher than mine.  His set up showed much more on the wattmeter, but that didn't matter.  Meters can easily be fooled.  It's what's actually heard on the band that counts.  Try doing more with less.  It's a lot more fun and very rewarding when your killing Goliath and looking like David.

From what i can recall, the Francis base antenna was a center fed dipole
much like the old Big Stick.  We used to put the 8' Francis in the top of a
Big Stick and ALWAYS obtained FAR better results in terms of RX and TX.  You
might have to slightly trim the Francis for best swr though.  Sean

Jay wrote in message <38529577.42D55907@qnet.com>...
Hello Ripsy:  No the Hot Rod" antennas are not available. I have talked
with thier engineer, a  few months ago.

However finding or making a bracket to put 5 Francis Amazers (one vertical,
and four as ground radials) should not be a big problem. The SWR will be
about 1:1.5, it will not be 1:1, but will work ok.

Jay in the Mojave

If we are strictly talking sensitivity, I would have to agree with MC's statement about single conversion radios. The old 858 SSB chassis had KILLER ears on them.

In terms of newer radios and sensitivity, the new Ranger board used in the RG 66's, 99's, 148 GTL DX +'s, Virage's, DX 2517's, DX 949 & 959's, etc... wins hands down.

Rejection is a whole 'nother ball of wax though......   Sean
>

MC 10kW Jesus wrote in message <3853F04E.F1826CD6@hotmail.com>...
Tested this one. It's good. The Grant XL is more selective and every bit as sensitive. Of course, the GrantXL isn't a 10/11m radidio. Someone mentioned the old Grant. I'll agree here too. I think you'll find that single conversion
SSB receivers are superior to dual or triple. Once again, more isn't necessarily better.

MC

It's impossible to find schematics for US AM radio's here in the UK!

Is there a simple mod to increase power out of this 4w radio?

Have peaked the output coils to no avail.

Is there an ALC mod? If so where and how?

Is a modded Cobra capable of driving a pair of 1446's driving 8 2879's?

Please help.

Thanks

Phil

I'm sure it will STOMP, given enough electrical system, antenna and drive.
My only concern is that it is weak on power cord.  While i can't count

exactly how many are there, you would need AT LEAST sixteen 8 gauge positive leads on that thing to do it justice. At anything less than that, i will GUARANTEE voltage sag when under a heavy load.

Other than that, it looks like Prozac is on the air. BIGTIME !!!! Sean

I own the Cobra version of this radio and just love it.  Everything i've
heard points to the fact that they are identical radios (aside from the
name on the front.)

If you want information on the radio, including mods, specs, the works,
pay a visit to my CB Page (link below.)  It's all there!

Just to clarify a little, what you got was a 2.5-watt CB, not a 5-watt.
The 5-watts is the power INPUT, not the output.

I can't say much for the unit, never used it.  My personal favorite for
a hand held is the Cobra HH-45WX (NOT THE ST!)

Good luck with you radio!

How many on the group have been in CB long enough to remember the old
"number" call signs, such as 19A1775 or 18QA3510?

How about separate channels set aside for truckers and interstate travel
at either the low or high end of the band?  No base stations allowed on
those most of those channels.  Say channels 1-5 for mobiles only with
channel 6 for base stations such as travelers aid or truck stops?  Maybe
would help clear up the other 34?

Would like to buy the proper stock mic for the 5010 as well as the
5010's box with the right styrofoam packing thaqt fits the radio. Would
also be interested in a stock mic from a 2510.

Jeff

Hi All,
I currently am using a 5/8 ground plane at 30ft with fair results. I would really like to get my antenna higher.The radials make it hard to get the ground plane in a tree,so I'm considering the A99 or IMAX2000.Is the IMAX really worth the extra cost?I like the idea of the 5/8 wave perfomance,but is there much difference in these two.Also how do they compair to the ground plane?
I've also heard some say the ground plane is prone to cause TVI.Are any of these antennas more likely to have this problem than the others?
I also have concerns about lightening at higher antenna positions.I would like to get one up about 60 or70 feet.Would these heights be cause for concern?What precautions would help?
I am having some trouble with TVI now and would like to solve this problem too.
Thanks for any help.

MC,

I'd have to agree with Sasquatch as well.  It's a matter of vectors.  If you look at how a ground plane works on a base antenna, each radial transmits the signal along with the vertical staff. This transmitted signal from the radials affects the "shape" of the vertical staff's propagation.  For lack of a better term they "diverge" from each other. For example, if you were to take two glasses of colored water, (one red and one blue), and poured them out toward each other, you would see some mixing at the point of impact but the majority of the liquid would spread out in a north/south direction, (the two glasses being east/west for visual reference). Co-phased antennas perform in a similar manner. One antenna is directional towards one path while the second antenna is direction in the other.  As the signals meet they take the path of least resistance which in the case of a semi would be forward and rearward directional.  I apologize for my long post but this is part of an experiment we performed in physics and it's hard taking 20+ pages of conclusion and condensing them to one posting.

For what it's worth, we put Christmas lights and a large star on the
tower of our low-band (46 Mhz) fire department radio one year.  Even
though the system uses FM, the QRM from the flashing lights was bad.

BTW, the lights were at least 10 ft. below the bottom of the antenna.
This project would be on my list of things NOT to do.

Hello Ripsy:  No the Hot Rod" antennas are not available. I have talked with thier engineer, a  few months ago.

However finding or making a bracket to put 5 Francis Amazers (one vertical, and four as ground radials) should not be a big problem. The SWR will be about 1:1.5, it will not be 1:1, but will work ok.

Jay in the Mojave

Took in a Uniden SPU-416KT 16 channel UHF 4 watt HT in trade.  I have no
need for UHF.  Would like to trade for  VHF or 2 meter HT, SSB cb/10
meter rig, volunteer fire light-bar, or make offer.

Radio seems to be in good condition, Three channels programmed, one repeater and two simplex. Battery holds charge. I don't have the charger for this radio. Great for GMRS, business, or high power FRS radio. (FRS not legal or advisable)

E-mail replies appreciated.

Jim, W8EMS/9 KWG2939

Toll, I have/can/still do run a davemade 16 pill with 1 - 250 amp alternator on the 16 I also do not run batteries and can hold close to the same watts with 1 -250 as with 2-250's hitting it. And I hold the same watts that guys using 3 or more  250's . I can also take a 200 and run the 16 on it now the volts drop from where the regulator was first set at say 18 volts drops to about 16 volts "remember I have no battery backup" , the watts are lower of course since i don't have enough amps to run it to it's full potential  but they are real watts proven by hewlett Packard  No one can tell what I am running and if it is being fed less current. Where are the harmonics coming

from?  If that is the case anyone with a stock charging system trying to run
a amp bigger than say a 4 pill is seeing bogus watts? I don't think thats
true they are seeing less watts because the alternator is only capable of
producing xxxx amout of power

I dont know about that.... Its free only if someone chooses to do it by themselves.  On the other hand, I still have quite a few people bringing their radios to me....  Though... most of them have been only Connex's... since mod's are a one time deal... and In the past 3 years there has only been one return of a radio... in which I admitted I made a careless mistake of leaving a solder drop in the radio....  I test them before they leave here, I guess the damn thing didn't short something out until a little while after the gentleman had it.... figures... Anyway, I suppose I explained myself already.... <g>

I have a Western Electric 104 Y Output Transformer that I would like to sell or trade.  I have a picture posted at;

http://members.aol.com/Reactor001

Make offer by email to < OvrReactor@aol.com >.

I'd prefer cash, but if you're looking to swap, I'm looking for unused compactron and magnoval/novar sockets, grid/plate plate caps, 7EY6's, 12AU7's, 20EZ7's, and EL34's.

Regards,
Tom Mitchell

Some Dude schreef:

> I've got a cd antenna mounting question for you all.  I'm currently debating between two possible cb antenna mounting positions, and I just need some help deciding between the two.  I've got a 48" fiberglass antenna.  (Wilson 1000)  I'm a newbie to the cb/radio world, so I apologize in advance for my ignorance on the subject.
>
> I don't want to drill any holes in my pickup (Toyota Tacoma), so that limits my mounting position choices.  There are two possibilities that I can think of for my truck that would seem to be good.  Could anyone tell me the pro's and con's of the two mounting positions listed below?
>
> 1)  Magnet mount on top of the cab.  I guess a benefit here would be the flat ground plane, correct?  Radio Shack has a big magnet mount kit that accepts standard antenna screw thread, and advertises that it will hold up to a 48" fiberglass whip.  I'd just have to remember to remove the thing when I park in the city.
>
> 2)  I've figured out a way to mount the antenna to a corner of the truck bed.  Toyota Tacomas have small, metal tie-down brackets screwed into each corner of the bed.  I can make a custom metal bracket which would bolt in place of one of those brackets, which would more permanently hold the antenna right there in the corner.  I figure a rear corner would be best. (Away from the cab.)  This has the benefit of providing a good ground to the pickup. (Is that important?  Seems like a magnet mount would not have that ground, since there's a big magnet and a bunch of paint between the antenna and the truck body..)  The only problems are that it's about 2 feet lower than where the magnet mount would be, and it doesn't have the ground plane.
>
> Any ideas?  (Please email if you can.)

This gentleman sells his wares n our ham magazines at at hamfests.

They are not bad covering 1.8-30Mhz with max output from a pair of
3CX800's.

They will not set the bowl alight at 3000 bucks a piece.

Phil / UK

Yes, the repeater split capability is only found stock on the 2600.
Of course, the bigger difference is that the 2600 won't leave the 10m
band without a chipswitch.  Look at www.chipswitch.com to see if it's
other features are worth it to you, if not get the 2510 which is
easily converted for cb.

If you consider that a 100% modulated AM carrier is drawing about 3.5A then a 2W "swinging" to 40W should be drawing close to 35A.

I don't think I need to tell you it ain't.

MC

You just have to look at the current meter on a bench supply to see that there is nothing inherently "30W" about a "swinging" AM signal on this radio.

Okay, I hear what you're sayin'. And because the two antennas are not the
optimum distance from one another for directionality, I think it could be

quite plausible that they are more omni directional than a single mirror mount.

MC

Tracer_B@webtv.net wrote:

> MC,
>
> I'd have to agree with Sasquatch as well.  It's a matter of vectors.  If you look at how a ground plane works on a base antenna, each radial transmits the signal along with the vertical staff. This transmitted signal from the radials affects the "shape" of the vertical staff's propagation.  For lack of a better term they "diverge" from each other. For example, if you were to take two glasses of colored water, (one red and one blue), and poured them out toward each other, you would see some mixing at the point of impact but the majority of the liquid would spread out in a north/south direction, (the two glasses being east/west for visual reference). Co-phased antennas perform in a similar manner. One antenna is directional towards one path while the second antenna is direction in the other.  As the signals meet they take the path of least resistance which in the case of a semi would be forward and rearward directional.  I apologize for my long post but this is part of an experiment we performed in physics and it's hard taking 20+ pages of conclusion and condensing them to one posting.

Does anyone have any suggestions for eliminating RF interference that's
creeping into my solid-state guitar amplifier?  The interference is
basically an AM radio broadcast that can be heard coming from the
speaker of my amp quite loudly!  I do live within a mile from an AM
radio station/transmitter, but haven't experienced too much interference
in the past, and none of my tube guitar amplifiers seem to have the
problem.

I've tried a radio shack RF filter for the AC power line, but this
didn't help.  A guy at raio shack suggested building a "Farraday Cage"
into the cabinet of the amp--i.e. line the cabinet with tin file or wire
mesh--but I was hoping for an easier solution.  Can I use some sort of
RF filter on the speaker wires? Any ideas would be greatly appreciated.

The biggest difference is the 2600 can't be modified for eleven meters (CB band) unless you change the PLL. It does not have a roger beep, does not have P.A. It does have a repeater offset switch and a switch to turn the RIT off and on. The 2600 also has fewer wires under the hood. There are also some small refinements in the overall design.

I have put a Chipswitch in my 2600 and it covers 24.8-30 MHz. It also adds a bunch of other stuff like memories. I unlocked my Chipswitch with a password and it will dial down to 20.9 MHz, but the VCO will let go around 23.5 MHz. I tried playing with the VCO to broadband it, but I just don't have the time anymore. If there is anyone else who has fixed their VCO to lock in the 15 meter band, I would like to talk with you about it.

The 4CX10K (which is a better tube to run on the base... Tetrodes require less drive, less input power, less overall station power consumption due to the fact that you don't need a driver, cleaner output, one less stage in line, etc., etc., etc.) with a Johnson Viking as an exciter will hold 10,000 watts all day long, for the rest of your life.

I have played with one on 220, single phase, using 100A service, dedicated. That service was used to power this amp, alone. The rest of the station shared nothing but the ground system.

This was allowing for 35Kw+++ headroom, PEP.

Yes I just found this out.  I received a catalog from MCM electronics and
the had a one 3-500z tube amp for half price on clearance. $600.00 I did my
home work and found out that Ameritron and it were Identical, or made by.
Too late they sold out the first day of advertisement.

If you get the right mix of ferrite, it will be VERY good at those frequencies.

However, an inductor, in series with a ceramic disk may work better.

Boy, I bet.

That is cheaper than the parts to build it!

However, used, you can get a dual 3-500Z amp.

'1975' 454 Chevy Suburban. Tan, body and paint in excellent shape. Runs great with all new black and gray interior and molded carpet (clean). Comes with 2 alternators, 1 -200 amp, external rectifier, and variable voltage regulator installed. New, never used. Also all the coax, 2 OT (I think?) power cables with disconnects already installed. Custom radio mount, I had a Galaxy Saturn mounted on it. Bitchen, custom machined, aluminum antenna mount. 9 new (never used) 6 volts heavy duty golf batteries. plug n play ready for a 16 pill. $4000.00 San Diego Ca.

KRS

oh yeah, SB 220 for approx. $350.00 will always do the trick.  I just pick up a home brew 3-3-500Z deck for $250, I need to install in in rack, wire up the transformer and put in new tubes and she' going to make be a great driver. Easier said then done, hehe.

Toll Free <

>not alter that fact.
>

You insignificant fool.  I do not associate with people who does not respect other users of the band.  It is not the intention of ours to interfere maliciously in any way, shape or form.  I feel that bandwidth that is not used by its assigned organizations above and below the CBRS allocated frequencies should be alloted to any user who so choses to use them.  Its bandwidth not needed but can be and not wasted.

Increased range outside of the assigned range for CB is an issue thatcan be brought about.  Reason?  If you're barefooted, and a station from Texas can hear you yappin' away local talking, subsequently asked for a "short-break" (at 5-7db's on your meter) would give him the go ahead with a signal like that resembling an identical barefooted station signal 10 miles away or would you just keep on talking just in case you think he's coming in like skip?  In any "putz" right mind, and if they are really nice guys, the local stations would give him the go ahead.  How would you know if he's hailing from the "Long Horn"?  Only if he tells you!

Increased power... why not?  For a Novice, its 25-1500watts depending on frequency and type comms.  Why not the same for CB?  Maybe something like 100watts legal operating limit and no more.  I'm game for 94 extra watts to be heard over Mexican skip.  Thats all I need in this town.

>>>
>>BS at its finest!
>
>Think so? I don't see the FCC issuing any Notice Of Proposed Rule
>Making about adding any more frequencies to the CB band, or modifying
>the power limits, or authorizing the use of FM. So either you're
>wrong, or you just have a reading comprehension problem and don't
>understand a word of what Dwight posted. Which is it?
>

But they sure took away code for Techs to attain a HAM license.  And what a BIG fucking stink the HAM world made of this.  GEEEEZUS Christ... Just for a bunch of blips?

If the FCC can make a big change in the Radio World like that (which is really insignificant to me) what makes you think they can't make changes to the CB band?

FM usage, Power Limits, Frequency addition can all be taken care of.  Am I wrong?  Depends on your narrow-minded thinking as far as you're concerned.

Reading comprehension?  More gibberish from former CBer's who got keyed on and went HAM so they can join the fraternity of bitching and whining about how CBers run power like its legal while I have to stay with in the specs FCC put out or I lose my license and get sent back down to the doldrums of the CBRS world and get keyed on again.

Shut up and quit the bitching.  Its too damn noisy here!  Fucking HAMs and their harmonics....

I'm surprised that nobody has mentioned that the ARRL has an
excellent book on the subject.  See http://www.arrl.org/catalog
for details.

............snipped........

> If you hack and slash the microphone audio circuit in the radio you can increase your audio band-width. But remember the person on the receiving end is listening to your signal through a very sharp a filter (okay some radios are crap and aren't too sharp) and if your bandwidth is wider than the receivers' filter, the fidelity of your Tx signal is going to be degraded. Another thing to consider is that
> some radios route the AM signal through the SSB filter so an overly wide AM signal is also going to be more difficult to copy with a "good" radio.
>
> MC
>

On SSB if you hack or slash the mic preamp it probably wont make that much of a difference because the filter is going to low pass limit your audio anyway. What will come through is the IM3 distortion created by the overdriven mic amps and/or balanced modulator because the products of this end up in-band with your main audio frequencies. The filter can't take out what is in it's pass bandwidth.

On AM, the usual results of hacking the mic or mic amp is an increased bandwidth. In fact, just overdriving the radios' speech amp and/or modulator will increase the IM3 products which, again, fall within the channel assignment.

I've made many a test on many different radios and find that the usual CB will Tx a very hi fidelity if the mic can reproduce it. I'm talking +/- 10 khz if not more. to make matters worse, if the audio has been distorted by overdrive you can be assured the signal will occupy a spectrum well into the next ch.'s up or down.

It seems to me that the audio used to modulate the radio would benefit from being band-limited as soon in the process as possible. This will ensure that the only sounds transmitted are the ones in the most effective bandwidth. I refer to aprox. 300 hz. to about 3500 hz. and possibly extending out to 4.5 khz.

I have a Western Electric 104 Y Output Transformer that I would like to sell or trade.  I have a picture posted at;

http://members.aol.com/Reactor001

Make offer by email to < OvrReactor@aol.com >.

I'd prefer cash, but if you're looking to swap, I'm looking for unused compactron and magnoval/novar sockets, grid/plate plate caps, 7EY6's, 12AU7's, 20EZ7's, and EL34's.

Regards,
Tom Mitchell

I'm looking at buying a new radio and being a "classic" big radio lover, I decided to give a digital, LCD display model a try. I drive local now, so I thought I'd give the "big" Uniden Grant a rest. I'm wondering how these three radios match up in a couple categories. Receiving, Transmiting, features, peakable/tweakable, Mods. I'm looking at a Cherokee CM-10+, Midland 77-115, Midand 77-285AXL. Anyone have any ideas on pricing for these models? I apprecite your opinions. Thanks

If you unplug the guitar, does it go away? Try a Radio Shack
ferrite core near the amp input. Wrap as many turns through it
as possible. Maybe add the second one.

If you have a separate speaker, yes, try a ferrite core near the amp.

Two things to do. First is quick and easy. Have the neighbor install a .01mF cap across the contacts on the microphone/mouth end of the phone.

Second is also easy but a bit time consuming. Obtain a #43 material toroid from Amidon or equivalent and using a couple feet of twisted pair phone wire, wrap at least 6 turns around the toroid creating a choke, and then in turn, splice it into the phone wiring in the wall so that it is invisible, behind the cover plate. This most certainly will take care of it.

I recommend a 102" whip or a Wilson 1000.

The radio is the source of the RF power to the antenna (unless you use an amp). The antenna must be rated to handle this load. It is best to over-rate the antenna power by a factor of 2.

However with a Wilson or a K-40 you will never be in danger of burning up the coil with your radio. The 102" whip does not have a coil and can handle more power.

Then that is the result of the company you keep. Not everyone on the band is a putz with no respect for other users of the band. The fact that you apparently choose to associate only with people who are does not alter that fact.

>>  When Amateur Radio is added as an existing option that can meet all of

>>
>BS at its finest!

Think so? I don't see the FCC issuing any Notice Of Proposed Rule Making about adding any more frequencies to the CB band, or modifying the power limits, or authorizing the use of FM. So either you're wrong, or you just have a reading comprehension problem and don't understand a word of what Dwight posted. Which is it?

73 and good DX'ing,
John D. Kasupski

Just thought I'd let everyone know I received my rebate from Cyberrebate for the GE handheld cb.  It was $64.95.  I also got one for the tool kit with the laser light for $49.95.  Actually I was surprised to really get them, but I did. Boy was that a deal.  Hope they get some more neat stuff.

My Connex 4800DXL's and Texas Ranger 699WX have great receive. From what I can tell the TR699 has a variant of the RCI 6900 board which is in the 4800DXL radio. I find this board to have stable SSB and awesome "ears".

Just my observations.

NEWSLINE 1165

Newsline report number 1165 for release on Friday, December 10th, 1999 to follow in

5-4-3-2-1.

The following is a Q-S-T.  The FCC says no to five petitions to change the face of ham radio and Kids Day is on its way.  These stories and more on Newsline report number 1165 coming your way right now!

(Billboard Cart Here)

*****

FCC TO HAM PETITIONS:  NO!

The FCC has turned away five petitions for rules changes including the very controversial request by the Central States VHF Society that would have mandated protection for weak signal spectrum from users of wideband modes like FM.  Rick Lindquist , N1RL, of the ARRL Audio News has the details on this latest FCC action:

-----

Lindquist:  "The FCC has turned down five more Amateur Radio-related petitions, including three filed by the ARRL. The FCC consolidated the dismissals into a single Order, released November 29. Among the five was a petition filed last spring by the Central States VHF Society. That petition, designated RM-9673, generally sought more restrictive regulation of the modes used by amateurs in the 6 meter, 2 meter, 1.25 meter and 70 cm bands.

The three ARRL petitions dismissed were RM-9259, filed April 3, 1998, asking for an FCC declaratory ruling to equate observance of voluntary band plans with "good amateur practice"; RM-9115, filed March 12, 1997, seeking to permit RACES participants and others to intercommunicate during emergencies, drills and tests and to expand the time allowed for RACES drills; and

RM-9106, filed March 12, 1997, asking the FCC to permit stations in the Territory of American Samoa to transmit on 7.1 to 7.3 MHz as a domestic exception to the International Table of Frequency Allocations.

The FCC also dismissed a petition filed March 19, 1997, by James Cardillo-Lee, KE6VGV, asking for a rule change to permit hams who also are emergency personnel engaged in disaster relief to use the Amateur Service bands while on paid-duty status.

The Central States VHF Society petition, filed May 3, had expressed concern about increasing encroachment into the so-called weak-signal portions of the bands above 50 MHz by wider-bandwidth modes, such as voice FM and packet. CSVHFS said voluntary band plans had not been successful in limiting the activity.

In turning down the petition, the FCC said that amateurs, including weak-signal adherents, already have been provided segments in the bands at issue that are off-limits to certain types of stations. The FCC reiterated language from another Report and Order that declared it was "unreasonable" to expect to operate in a totally interference-free environment. The Commission also expressed concern that "subdividing amateur service bands on the basis of operating interests would result in a loss of flexibility to accommodate changes in operating trends and emergence of new technologies." The FCC said it agreed with the ARRL's position on the CSVHFS petition that education and the application of existing rules should suffice to minimize interference among various modes.

In dismissing as "unnecessary" the League's request for a declaratory ruling to equate band plan adherence with "good amateur practice," the FCC noted that a basic amateur principle is that "all frequencies are shared, and no frequency will be assigned for the exclusive use any station." The Commission suggested it was reluctant to expand its regulatory role beyond the existing limits on the emission types that may be transmitted in different subbands. The Commission, however, did reiterate existing prohibitions against willful and malicious interference.

The FCC said the requested changes "would have the effect of transforming voluntary band plans into de facto required mandates," something inconsistent with current FCC policy.

In denying the ARRL's petition for changes in the RACES rules, the FCC said the League failed to demonstrate a separate rulemaking was warranted. The FCC noted that it's currently considering "the necessity of separate licenses for RACES stations" in another proceeding.

>I'm Rick Lindquist, N1RL.

-----

With these matters now out of the way, there is a good chance that the F-C-C may turn its efforts to finalizing
the order to restructure the overall Amateur Radio service.  A few weeks ago the ARRL reported that there could

be a release on this before years end. (FCC, ARRL)

## FCC TO POWER COMPANY: FIX THE PROBLEM

The FCC has told the to Pacific Gas and Electric power company that it has an obligation to fix equipment problems that cause harmful radio interference, even if the interference is only to ham radio operators.

The case involved long-standing complaints by several northern California amateurs to Pacific Gas and Electric Company regarding severe power line noise on the ham bands. On November 22, the FCC's Consumer Center wrote company Vice President James K. Randolph, requesting the company act to correct the problem within what the F C-C termed as a reasonable time.

Under Part 15 of the F-C-C's rules, utility companies and others that fall under its provisions are obliged to not cause harmful interference to licensed services . They must also cease operating a device that's causing harmful interference upon notification from the F-C-C.

The FCC said that its letter was intended as a reminder that the unresolved interference problem may be a violation of its rules. Also that it has the power to levee a fine each time a rule is broken or ignored. (FCC, ARRL)

*****

## FCC EXPLAINS WARNING ISSUED TO AF2Y

A follow-up to last weeks story concerning an FCC warning letter issued to Charles Schwartzbard, AF2Y, of Clifton New Jersey. As reported, in it's November 2 nd letter to Schwartzbard, the FCC alleged that AF2Y had apparently been operating his station in a manner that causes it to emit an unusually wide signal, one that is over-power, or both. The letter also cautioned Schwartzbard that airing personal conflicts with other licensees on the Amateur bands, or slander or deliberate interference to other licensees would result in the loss of his Amateur license.

To our knowledge, telling a ham that he could not air a grievance or transmit language that could potentially get him sued for slander was a first. The reasoning became quite clear when the FCC's Riley Hollingsworth, K4ZDH, explained on the RAIN Enforcement Log that this particular situation required some direct intervention by his office:

-----

Riley Hollingsworth: "The letter also contained a warning concerning airing personal disputes or slander or arguments with amateurs on the Amateur bands.

This was an extreme case. We had allegations on it for quite a while and we had been watching it.

You can have disputes on Amateur Radio, but in extreme cases where you may be instigating or slandering other Amateurs, of coarse we do not tolerate it."

-----

By the way, for the latest on ham radio enforcement action, direct from Riley Hollingsworth K4ZDH, take your RealAudio equipped Internet browser over to www dot rainreport dot com. Click on the FCC Enforcement Log and sit back and listen. (FCC, RAIN)

UK HAMS SAY YES TO INTERNET REPEATER LINKING

Hams in the United Kingdom are quickly saying yes to a British telecommunications agency idea to permit Amateur service repeaters to be linked via the Internet. Jeramy Boot, G4NJH in Nottingham in the U-K has been following the story and has the latest:

-----

Boot: "Further to the report of the 7th of November concerning experimental linking of Amateur Radio to the Internet.

The Committee of the U.K. F.M. Group - Western held a meeting on the 8th of November at which they agreed to cooperate with such a project. The group operates eighteen repeaters in the North-West of England. It is prepared to make its 433 MHz GB3MT voice and data repeater on Winter Hill available for such experiments subject to Radiocommunications Authority and RSGB agreement.

>Jeramy Boot, G4NJH.

-----

The Radio Society of Great Britain's Repeater Management Committee has also been following the recent proposal.
It says that it supports and encourages the open-minded attitude of the Radiocommunications Agency provided that it does not introduce elements of abuse to any aspect of Amateur Radio. The committee also says that this kind of linking could be a way of increasing activity and making amateur radio accessible to many people who might not otherwise consider taking up the hobby. (G4NJH, RSGB)

*****

KIDS DAY

Closer to home, the first of two of the most important ham radio operating events of the new millennium takes place on Saturday January 1, 2000. This will be the first Kids Day of the new century and it is important because it could easily be the key that assure a crop of new and vibrant young hams will be a part of the hobby for decades to come. Jean Wolfgang, WB3IOS, is the Educational Activities Coordinator for the American Radio Relay League:

-----

Wolfgang: "Even if they don't go into radio immediately, you do not know what is going to happen in five ot ten years. And that is why I think it is so important."

It is easy to take part in Kids Day. All you have to do is open your home and station to one or more of the children in your area. Invite them in, let them talk on the radio and exchange a Kids Day greeting.

-----

Wolfing: "The suggested exchange is the child's name, age, location and what their favorite color is."

----

According to reports of past Kids Day operating events, a significant number of youngsters have become interested in ham radio and some have even gone on to get licensed. And that's really what Kids Day is all about.

So from 1800 to 2400 U-T-C on January 1st of 2000, invite a local kid to share ham radio with you. You will both be glad that you did.

For more information on Kids Day 2000 please see page 48 of the December 1999 issue of Q-S-T magazine. (ARRL)

## 90th BIRTHDAY FOR FAMOUS RADIO CLUB

An institution in the world of wireless celebrated a monumental event on Monday, November, 29th. That's when the Radio Club of America, an organization for professionals in the radio communications industry celebrated its 90th birthday.

Back in 1909, when it was founded, radio communications was very much in its infancy. The league of pioneers of radio technology who belonged to the club over the years set many milestones in broadcasting, mobile radio and other industry sectors.

The Radio Club of America has seen the huge explosion in radio broadcasting, then television, through to today's enormous worldwide use of the mobile telephone. While not an Amateur Radio club per-se, many well known hams can be found listed in its prestigious roster of members. (RCA, Q-News)

*****

## FCC CREATES NEWS MEDICAL IMPLANT SERVICE

From the FCC comes word that it has established a new Medical Implant Communications Service or M-I-C-S operating in the 402 to 405 MHz band. In rendering its decision, the FCC noted that operation of today's medical implant devices requires that they be magnetically coupled to external programmers or readers. This requires very close spacing between the implanted device in the patient and external control equipment, often requiring body contact and very slow data rates that can take up to fifteen minutes for a single data transfer.

The Commission says that by creating the new Medical Implant Communications Service will permit the use of ultra-low power radio-controlled devices such as cardiac pacemakers and defibrillators. This says the FCC will save countless lives.

For more information go to the web at http://www.fcc.gov/Daily_Releases/Daily_Business/1999/db991130/fcc99363.txt (CGC Communicator, FCC)

*****

## SHERYL SEGAL DEPARTS AS FCC WEBMASTER

Still with FCC news, word that Sheryl Segal has left her post as FCC Webmaster, but will continue to work on document management for the Commission.  Under Segal's guidance the FCC web program has grown into a vibrant and essential government resource that directly serves the citizens of the United States.  (CGC Communicator)

DX'ER CHOD HARRIS VP2ML - SK

I'm Bill Pasternak , WA6ITF with word that the changing of the guard in ham radio continues as a name synonimous with the world of D-Xing has fallen silent.  This as the worlwide ham radio community mourns the loss of CQ magazine DX columnist Charles J. Harris, WB2CHO.

An active contester and DXer, Harris had operated from a number of exotic locations.  It was during that time he obtained his distinctive second call of VP2ML.  C-Q Editor Rich Moseson, W2VU, had these thoughts to share about Harris' passing:

-----

"All of us at CQ will miss Chod. He was our DX Editor for ten years. On one level, he lived a life that many hams only dream about -- operating from exotic places like Christmas Island, the Galapagos, and of course, Monserrat, where he lived part-time and got his VP2ML callsign. Chod devoted much of his life to ham radio, but it was a life that was all too short. He was only 50 years old when he died this week.

Chod packed a lot of life into those 50 years, though. He started out as a schoolteacher, then went to work for the ARRL when his doctor told him he needed a job with regular hours and less stress. At least he got the regular hours. When he left the League in the late 1970s, Chod did a lot of operating from different places and got involved with a variety of publishing enterprises, including a woodworking magazine, the weekly "DX Bulletin," and "DX" magazine, which he started in 1989, then sold a few years ago.

Chod's dedication to DXing was obvious in the location of his home on a California hilltop with a good takeoff angle over the Pacific, and even in the name of his dog -- which is Dog X-Ray."

-----.

Harris passed away on December 8th of complications resulting from a severe heart attack he'd suffered in November. In lieu of flowers, the family has asked that donations be made to the American Heart Association or to the Northern California DX Foundation.

I', Bill Pasternak, WA6ITF, in Los Angeles for Newsline. Tony. (CQ Magazine, ARRL, others)

## ANTARCTICA SATELLITE HAM RADIO EXPEDITION

Ron Ross, KE6JAB, is again on a trip to a mountain area in Dronning Maud Land, Antarctica that was scheduled to begin this past week. Spacenews reports that this will across-country skiing and camping trip, pulling sledges from mountain to mountain.

Similar to his last trip, Ron has with him an Amateur Satellite Radio Station. He will use it to transmit text messages and images from Antarctica back to a website in San Francisco, California. The messages will be distributed through a mailing list, and images will be posted on his website.

Ron will try to send a travel report and a new image each day. He expects his mini ham radio satellite expedition to last the entire month of December. More information about the trip is available at www.thistle.org.

## SA 40 METER INTRUDER WATCH

South African hams are on the lookout for pirate broadcasters and other stations that violate the Amateur Radio bands. Newsline's Mert Garlick, N6AWE, explains Intruder Four Zero:

-----

The South African Radio League in conjunction with the International Amateur Radio Union Monitoring System is embarking on a new forty meter band monitoring program called Intruder Four Zero. Listeners are asked to log non amateur stations that are intruding between 7000 and 7100 Khz and note any information that they can.

Project Intruder Four Zero runs through the end of the year.  Although the section 7 point 000 to 7 point 050 MHz is a shared band in some nations, the South African Radio League would appreciate reports of non-amateur operation. Please send your reports to Glen Duffy ZR5GD by e-mail to iarums@futurenet.co.za

-----

Again, Intruder Four Zero reports go to Glen Duffy ZR5GD by e-mail to iarums@futurenet.co.za.  (SARL)

## CANADIAN ARES MANUALS NOW IN FRENCH

Radio Amateurs of Canada has announced that two publications relating to the Canadian Amateur Radio Emergency Service are now available in French on the R-A-C web site. Both may be downloaded and read or printed at no charge and viewed using Adobe Acrobat Reader. (RAC)

*****

## NEWS FROM 4X

The Israel Amateur Radio Club will remain the Israel Amateur Radio Club.  Last year, some Israeli hams began a campaign to find what they considered to be a new name that they felt was more fitting as we approach the 21St. century.  Some hams wanted the name of the club to change to Operators of Radio and Communication.  The matter was brought to a vote at the I-A-R-C executive council, where it was summarily defeated.

Also from Israel comes word that the Jewish National Fund in charge of forestation and other land improvement has agreed to sponsor the clubs special operation for the year 2000.  Their contribution will be the printing of Q-S-L cards and certificates for the event.  (Hagal International)

*****

## DX

In D-X, word that Paul Blumhardt, K5RT, has been appointed CQ Worked All Zones Award Manager, effective immediately, by Dick Ross, K2MGA.  Ross is President of CQ Communications, Inc. and Publisher of CQ magazine. Blumhardt succeeds Jim Dionne, K1MEM, who passed away in October.  (CQ)

On the air, news that the 9M6AAC Hillview Gardens Resort station in Borneo is now active.  For current updates and photos, check the web page at www.qsl.net /n-2-o-o slash borneo.  (DX Digest)

Also PA3GIO, reports from the Isle of Jersey that he has to use an M-J prefix instead of the G-J as first reported.
Look for him to be active as MJ/PA3GIO from December 11th to the 16th.  (OPDX)

And several new D-X beacon stations make the news this week.  Again Jeramy Boot, G4NJH:

-----

Boot:  "From Martin Harrison, the Region 1 High Frequency Coordinator, comes the following beacon news.

The latest beacon in the worldwide HF beacon network, RR9O, has been heard in the UK with good signals. This beacon is located at Novosibirsk in Siberia and, like the other beacons in the network, transmits for ten seconds in sequence on 14.10, 18.11, 21.15, 24.93 and 28.20MHz with four levels of power - 100 watts down to 100 milliwatts. The final station to complete the 18-station network, is expected on air from Hong Kong shortly.

There's also another new 10-  beacon, A41RB, now in operation from Oman. It is run by the Royal Omani Amateur Radio Society, transmits on 28.194 MHz with 10 watts to a Cushcraft AR-10 antenna, and is sited at locator LL93FO. The power will subsequently be increased to 100 watts"  (G4NJH)

-----

More D-X news, next week.

*****

TRW SWAPMEET - ON THE MOVE CHRISTMAS DAY

And finally, guess whats happening in Southern California on Christmas Day?  Yes, the kids will all be up early to open the gifts that Santa left under the tree, but one member of the household may be missing.  That's because a very popular event will be taking place on that morning.  We are talking about the famed TRW Ham Radio Swap Meet.  It takes place the last Saturday of every month and according to the T-R-W Radio Clubs' Wendell K. Young, KE6ASC, even a change of venue and Santa Claus himself can't close down this event:

-----

Young:  "Actually the property we hold the swapmeet on changed hands in November. We did get some leeway from the City of Manhattan Beach to hold the swapmeet there in November, but we are moving to our new location in December.

The [swapmeet happens the last Saturday of the month and the] last Saturday of the moth happens to be Christmas morning. we are [however] going ahead. Come rain or shine -- or holidays -- we hold it in the last Saturday of the month."

-----

If you are one of the tens of thousands who will be in the Los Angeles area on Christmas Day, and want to do something completely different, then the TRW Amateur Radio Club has an invitation for you. Wendell Young, KE6ASC, says to drop by. Its in the suburb of Redondo Beach only a short drive South from Los Angeles International Airport:

-----

Young: "Head south on the 405 Freeway, get off on the Rosecrans offramp heading West. Continue westbound until you get to Aviation which is the stoplight with the train-bridge overpass. So left which is southbound to Spacepark Drive which is one traffic light south of Marine."

-----

The monthly TRW Swap-Meet began in 1974 hand has become one of the nations best known monthly ham radio bargain finding events. And if you do decide to show up on Christmas Day, you can still make it home in time for turkey and all the fixings. Wendell says that the meet starts at about 7 AM and is over around 11:30 AM Pacific Standard Time. (Newsline)

hi,i have the following for sale.all gear is in great working condition and all radio's are tuned-up:

1 cobra 148GTL with x-tra channels in hi/low and brt/dim switches..and a 5-tone roger beep in the cb/pa position.radio sounds great and is cosmetically a 6-10 (has 2 holes were switches usd to be mounted on top case and a few scrapes here and there).$100/or $115 with cobra power mic

1 uniden grant LT with x-tra channels (no skips) in cb/pa-hi/low-brt/dim switches..6+/- open clarifier..fully modified..only used a handful of times..looks brand new with all original accesories (box,manual,etc.)$150

1 PDC-256 internal freq counter..with paperwork and box..good condition.$75 or will sell installed into either the 148 or grant upon request.

1 silver eagle desk mic looks new..works fine..have box.$50

1 cobra power mic $15 looks and works fine.

1 2-tone roger beep board nice sounding (for a roger beep) $15

i would love to sell as package or partly-packaged but will settle for seperate buyers..any questions or if you want to work anything out email me at Jayedie11@aol.com i will also do any mods or wiring that you need upon request (although most mods are already done).. prices are negotiable in package or partly packaged deals.....73's

Im very new to CBs and purhcased 2 COBRA handhelds recently. Is it as simple as replacing the standard rubber ducky antenna with a mobile antenna for additional gain? What if I install a mobile antenna on the roof of my home so I can use the handheld as sort of a base radio. I've heard of calibration stuff but is it necessary as I plan to use the radio within a 4-5 kilometer distance only. Any help is appreciated.

The input impedance of the amp is going to be in the
mega ohm range. Sine the ferrite acts as a impedance in
series with the input you would need to find a ferrite
that provided a significantly higher impedance than
the input impedance of the amplifier even if the amp's
input impedance drops to 100k ohms at the AM band.

Tim what else could he have done if he was being heard allready. Lets say he
was holding 2500 watts with 1 alternator, lets assume he got 1000 watts more
by adding a second alt . Do you think anyone would be able to tell the
differance?

Sorry, haven't been out here for a few days.  You are forgetting ONE vital
thing about big trucks with box trailers.  The antenna is not above the
ground plane, but running parallel to it.  It completely changes how the
antenna works and it's radiation pattern.  Sean

Probably in '58 at the age of 2, someone may of put a CB microphone in my hand & told me to go to town, but I'm not sure about this part!
I went to a school mate's house in the early - mid 60's & saw his dad talking on a Tube base station.  My friend had strong 100 mw walki talkies, or maybe they were 1 watt or 2.  I got 100 mw walki talkies & put 2- 9 volt batteries in series for MORE power (the 1st kicker!!!) .  This with longer wire antennas produced more signal than many "pill heads" do today!!!  Then I tuned the receive coils to hear the 11 meter SWL band.  Then made SW radio as a knight-kit and got other 100mw walki-talkies.  Used hand helds in the 60's to "spy" on other kids in the 'hood after watching too much "Man from UNCLE" and Lost in Space TV  programs!  In '72, borrowed a base & got my 1st base--a Lafayette 924.  Got out of CB in '73 because "it was getting too crowded !"  Started working for a CB shop in fall '76, went to work for Hy-Gain in Neb. & AS in Cleveland  in around 76' &  '77, & started my own CB shop in '79.  Still do it today!  Only the Lord could of cause me to get into CB !     I is gettin' more fameous as time goes on!  In '82  listened to cordless phones on 1700kc, before the communist law system came in that said that we could not "intercept" phone calls, but we could still RECEIVE them under the U.S. Constitution, so I got some of the "blockwatch" old ladies in trouble by passing the tapes to the cop head of it !!!!  But that is cordless phones so I am off point.  CB leads to other things, right Hambo's ?
Dave!!!

Oh yes they do! All transistor amplifiers have great potential to rectify and demodulate AM radio.  The base-emitter junction of the input amplifier is probably doing the rectification, and fitting a small 1nF disc ceramic between base and emitter may fix the problem (if you are up to delving inside the amp.

Otherwise, I would suggest trying a 1nF disc ceramic capacitor from input to ground at the plug going into the amplifier.  This will shunt any RF signal picked up on the inner core of the lead to ground.  I assume there is no breakthrough when the input lead is not connected

I have a clean Cobra 2010,it has the clarifier opened up,and a rotary switch that gives 26.315 to 28.045. The vco circuit has been changed to allow the radio to cover the frequency range it does. It also has variable power,and a cord to key amplifiers with. The radio is a 9 on a scale of 1 to 10.

Its best to remove the Xtal filter using PIN diodes.  Most radios use
this method.

Totally correct Bob.

Ok, if I follow what you are saying, (correct me if I am wrong) your feeding audio and carrier to the balanced modulator. You get both sidebands at the frequency of the RF that was fed to the balanced modulator. But the audio is being filtered out to provide a DC bias for the audio IF? That leaves you with nothing, The balanced modulator removed the RF (a major portion) now you filter out the audio? The steady carrier you refer to is about 30 dB down from what was inserted.

>
>Carrier Balance? AM Power? Well, I'm not trying to derail the whole

>drive is set by the NPN/PNP AM regulator section using DC bias for
>linear operation for Audio with a DC component applied while in AM.

You won't have any carrier being fed to the latter stages unless you unbalance the balanced modulator. What kind of AM would you have if you didn't unbalance the balanced modulator? DSB unless it was fed to a filter.

>
>[If you offset the carrier balance in AM, you'll find yourself with a

>this on your pride and joy HiPo miracle of a radio - you'll sound, as
>well as hear, a lot of noise from people yelling at you...]

Where would you get phase modulation from? Playing with the carrier balance would only change the carrier level.

>
>The typical AM portion of the radio [read:AM regulated CB AM/SSB
>radios] in AM mode - act much like their Modulation Transformer
>counterparts, but are directly driven by the Mod AMP transistor into
>the respective Collectors of the Driver and Final pair.

Where is the carrier (or RF) being generated? How is it being fed to the drivers and finals? Read Bob C. 's post. He's very accurate on how its done.

I ran my 32 pill on one 250 amp leece today with an m400 se driving it in my
buddies car (#7). Needless to say there was some major voltage drops but it
was pegging the shit out of a dosy 400 watt meter. His 16 pill almost does
the same thing but not a full peg like the 32 pill. This tells my he is
driving the 16 pill and still has current to spare.....

If you were on the bowl you probably heard it since the BYU was coming back
to us for over an hour..

Thats the only type of meter I would use. I can hold around 1800/2000 with a 200 amp leece holding 16 volts and at the very least around 2400/2500 with 1-250 amp alt on the 16 pill alone, the peak watts are there as well. I don't see where this is a outragous claim I didnt say i was holding 750 with a 2 pill or anything like that. 250 amps x 18 volts= 4500watts @ 55% eff = 2475 watts I may be on the low side with 55% . And you are not even taking into account the battery power. Thats what happens when you have an amp that is fairly effiecient.

looks.

In some cases you are right, But I never have any problem getting to any of
my stuff. I have already done it without the looks in the past, everything
was exposed, that got boring. I get performance and looks all in one
package.
Yes it was a challenge to make it functional but it was never boring.

----------------------------------------------------------------------------
------------------
When I volt up and watts go down? Sorry I have never experianced that. The
alt is only capable of producing  so many watts. Whether it be on a 16 or a
8 pill etc. I can take the same alt an run a 8 pill on it at 20/21 volts I
```

will see close to the same watts as a 16 pill  on the same alt at 15/16
volts.

>
> Guess your right....  You don't see any harmonics.
--------------------------------------------------------------------------
yes at about 40 db down on the 8,12,16's  Also no change in harmonics from
15-22 volts

Have never seen this either. Sounds like the left handed drafting pencils
we sold freshmen in high school drafting class.  An instrument cable is
just a
shielded cable.  No "polarity". It's a piece of wire.  That's it.
>

How about the pickups.  Those big beautiful coils will pick up everything
from TV to flourescent lights.  Do you have all single coils?  Have you
tried a guitar with a humbucker?  Your pickups may be crappy (no offense,
most stock pickups are, if yours are stock they may be.)  Have you tried a
friends guitar?
I believe you said you also have tube amps that don't do this.  Amen for
tube amps. I'd stick with those.  Also check your grounds in your guitar
wiring and in your amp.  If a ground is oxidized or has become
disconnected, noise will result.  If your amp has effects loop jacks, they
may be dirty or not closing, as well as your input and headphone jacks.
The best advice I've seen is to call the station.  Don't complain, just
ask.  Most engineers will be more than happy to help you.

Jay

Look Jeff Herrings/Hank Aaron/Whomever,

My post wasn't directed to you anyway. This group used to have guys that would contribute their knowledge to someone that did not know. They have left due to idiots trying to defend their two word replies and those that would rather debate these small issues like yourself. It would have been nice if you would have told him why such an idea would not have been good but, instead, you choose to email me with more tears. Just think, If you had as many words in your post as the "........" you had in your email, we would not have to go through this.

Anyway, I have a solution for you. Put me in your filter file. That way I won't get any more of your trivial comments and I won't have to screw your day up any more than I already have.

Sorry, CW is not allowed on the CB bands. It would be helpful however.

I like the idea and the mode plus its easy to add CW to an AM rig.The
problem for me is it's not legal!

Will my 02A & 858 CB's make it to Jan. 1st ?  Or will my VFO go off lock
then?

Will I have to get my synthesized units back out to key down in a Geek
destroyed world?

IF dem idiots declare marshall law, we can use CB to get our republic back!

Will da Hambo's be with US or da un ?

Dave!!!!!!!

it used to be way back in the olden days that channel 15A,was reserved for
100mw code,there were boy scouts all over the world dit dahing on those old
units , anyone else remember them ?

Kinda makes you wonder why it isn't happening these days anymore. Was this after
11m became
a Citizen's Band by chance? :(

I give the petition an A+ for trying but I think this one will not find
much serious consideration in Washington except to ask why DX on 27 MHz
when 28 MHz Ham is available?  Too many complaints about High Power &
Interference have almost doomed the personal radio hobbies.

just heard a local who picked up a davemade very recently and damn did
he sound choice. no doubt about it, no clipping on the audio, strength
without distortion and quick turn down the rf gain on the rig 'cause of
the damage he was doing to the hammers&anvils in the cranium....

I just been ignoring all love you's post. If that name shows up in
my sender area, I immediately go to the next message! (I do that
with other people, too!)

What hobbies, I thought 27 mhz was the only sour point in the personal
radio services?

It's not a very efficient antenna. There are others on the market that cost less or about the same and will do a better job. You're on the net, with a little investigation you'll find a better antenna system.

Okay Jim... Lets put things into perspective. If you wish to point fingers like an irrational child. I'll play you're game, though, I will keep it rational and only play this once. My turn.

[Fellow] I was thinking about wrapping a set of Christmas lights around the
[Fellow] Antron 99. Would this have any effect on SWR at all?
[Fellow] Thanks

[Me] Probably... If not yes.....

[You] I can't believe this post has been here since 1:30 and the best reply is a
[You] "probably". This isn't the group I remember.

Now. I did not have all the time in the world to give a lengthy reply to this fellow. So, I answered the question without a lecture on VSWR and propagation. See, I did at least reply, which, there are only a few that do, and answer questions PROPERLY. I gave the proper answer.

Again:

Will Christmas lights affect my VSWR, my answer, YES. Read beyond the probably.

You want to go on and talk how it is people like me who make those who contribute run away.  Got a question for you then Jim.. Where have YOU contributed?  What are the specifications on the uPD861?  Oops, I answered that already.  How do you disable the SoundTracking on the ST Cobra line so that you can perform the "swing" kit.  Oops, I already answered that one too.

Seems to me, you are the only one "crying" or shedding tears around here. As you can see by the date and time stamp of my email, you will see it is BEFORE you replied on the newsgroup with:

[You] No offense taken.....Hey, I saw the grin!  Gee, and I thought you had
a
[You] sense of humor too?

If you take notice then, I left it at THAT.  I did not feel compelled to "get the last word in" such as you have done below with your post.

As far as a debate...... Im through with this, and if you stay awhile, Im sure you will see that your below statement is in error. Because my friend, I DO contribute.  Oh, putting you in my "filter" is not a solution my friend, in that case I would be taking orders from you, but it doesn't work like that.  I appreciate your SUGGESTION, but I would rather now just laugh at any other posts you have to offer the newsgroup.  I wont even go on about the "spamming" of ham gear someone keeps trying to pilfer off.  Take care.

I really like my Midland 77-115- its cheap, sounds decent and its small so I can move it from vehicle to vehicle...The weather is a great feature too.

73s,

Mudpuppy

Well, it is treated as a "hobby' to certain extent, what do you think
about the Petition, and have you read it?

maybe, maybe not, it all depends. i think the government is going to crash
and for that i could care less, but there will be a lot of 'suckers of hind
tit on the government sow' , who will be hacked off about it, too bad. i
think it will be gloriously funny,......icm out....

Buy a map dingus.

Oakland and the High Desert (Mojave) are quite a bit of ways from each other...

To the tune of a day+ drive.

Get a copy of Code Quick. It's a set of tapes that teaches you code by sound association. I used it and learned the code in 3 days. Then goto www.qrz.com and download supermorse and use it to practice with. I did that for 2 weeks and went to take my novice and tech exam and planned on taking the 5 wpm

code exam but after hearing the 20 wpm exam decided to try the 13 and I
passed it. Went a month later and took the General theory, 1 month later
took the Advanced theory and passed the Extra class 20 wpm code test.  Code
Quick is the way to go.

73 and good luck,

Hey man I will get the amps up on the site eventually, I borrowed the camera and took a $h!tload of pics, amps included and did not like the amp pics, as I said before I know very little about the webpage building hobby and HTML but I am learning because I believe that if you are going to put up a site and advertise it, you ought to keep it up to snuff, which I would like to do on my own. I will have my camera here real shortly, I decided to go with a good camera and I had to wait till after the holidays to afford it, I then will add amp pics, step by step alternator installs, and some other projects for people to view and hopefully use to their advantage, With the camera I am looking at I will be able to take real clear close up shots...... in time...

It's called a 'quick disconnect' PL-259 plug.  They can STILL be ordered
thru the FIRESTICK antenna company. Yes, you just press then onto your
SO-239 plug. No more screwing/unscrewing.

|
|Heh Heh...
|
|Hey, where can I get a decoder ring?  I want to play!  :-)
|
|Specifically, what is a "pill", and what does the number signify?

"Pill's" - RF Transistor commonly found in linear amplifiers.  They are
usually white and
look like pills that you would get from your pharmacy (if your
a horse that is).

|
|And what's a "leece"?

Leece-Neville - Most popular alternator used in vehicles which run a lot of
power (as in
watts) on the CB.  Ranges from 200 - 350 Amps
(common sizes) in
short and big case/block (term used in my area)

Hank

Contrary to popular belief, not all CBers are knuckle
dragging morons; a few do care about the quality of their
signals, and some do endeavor to avoid interference problems.

The ARRL publications (such as the Handbook) are excellent
reference sources for people in a wide variety of radio
related disciplines.

Hmmmmm... Seems someone is really wanting to be me on AOL...

a freind of mine sent me RF RadioMan's profile...

look......
------------------
Member Name: Chuck
Location: Michigan (near Detroit)
Birthdate: 1972
Sex: Male
Marital Status: Single
Hobbies: Duh!
Computers: Amd 300
Occupation: Truck Driver
Personal Quote: Don't quote me on that! LOL
---------------

Well, Beleive it or not. it's not me.... someone who knows me really =
well is doing this.... guess I'm going to have to make a few phone calls =
to strighten this shit out.=20
```

Again Rfradioman@aol.com isn't ME!

Thanks,

-Chuck

The cable between the guitar and the amp is most likely acting as an antenna, with the inductive reactance of the pickup in the guitar.  The input ciruit if tube type or solid state is acting like a detector for the signal.  If for example, the pickup is a 47kohm device, try putting a ceramic cap accross the input of the amp.  This must be done on the inside on the terminals of the input jack for each input.  I would try a cap value of 100 pF (picoFarid) / 200 Volt rated.   The voltage rating can be much higher if desired. These commonly come rated at 1 kV average or higher.  This cap is wired from the hot-side or tip of the jack to the signal ground.

You can try a higher value if you want to experiment. I would than by an assortment of these starting from about 80pF up to about 470Pf to try. When you have one that works great, then just do the same for all the other inputs.

Increasing this value too much will result in a loss of high frequency responce. If the value is small enough, it should not have any hearable effect at audio frequencies. It is an easy way to bypass the high frequencies to ground that are comming in along the interconnect wire. The best is to experiment with this. The idea is to try to bypass any frequency to ground that is above 100kHz or so.

Siltronix 1011B, good condition with new tubes including a N.O.S. in it's original
box Amperex
high output 6LF6. Comes with mic, manual, and schematics.

The "B" model is better than the "C" and "D" in that it has more coverage on the
band selector, the
switch has (5) bands CB, 28.000, 28.500, 29.000, 29.200 Mhz. The output of this
transceiver is
approximately 150 watts with the new final tube and tremendous audio that none of
the solid state
CB's can touch.

It also has the reasonably priced 6LF6 opposed to the $85.00 8950 tube as the
final.
I am asking a firm $150.00 or a trade such as a tube linear amplifier with an
output of approx. 300
watts. Let me know what you have. Buyer pays shipping from Connecticut.

Thanks,
Kevin

"Hello friend's this is Mr.Audio Snatcher for you skip
talkers. I run channel 23,26,11 and Super Bowl 6 and sometimes 835 but
most of the time I bleed them all".

Not every CBer is as ignorant as this guy.  Unfortunately, folks like Mr. Audio

Snatcher seem to be a growing majority. The FCC will likely not take seriously
any petition to expand the CB channels that gives these guys additional
spectrum
to proudly "bleed" onto.

Please don't flame me for this because I know every one on the news group feels the same way. You are trying to make a living or what ever fine, but you are doing it the wrong way. Do you realize how desperate you look? Post a message saying $TONS OFF STUFF FOR SALE$
then list all the stuff. this way if someone is looking to buy something that will be where they look. No one wants to read 20 messages from the same person selling %$*#@.

Please just think about it before you attach me for trying to help you.
Please!

If it is biased up, as it should be, it is hardly non-linear. Sorry to be a wanker here.

> Otherwise, I would suggest trying a 1nF disc ceramic capacitor from
> input to ground at the plug going into the amplifier.  This will shunt

I wouldn't do this myself. This will load down the input stage more and could introduce other problems as the input to a guitar amplifier is (read: should be) very hi-Z. And besides, everyone knows all the -best- guitar amplifiers don't use transistors. :->

XLR (balanced) type mics use this also but in their case the shield is not common with either conductor. Similar principle though.

> Have never seen this either. Sounds like the left handed drafting pencils
> we sold freshmen in high school drafting class.  An instrument cable is
> just a

Hee hee! I know what you're saying/thinking. There is a definite benefit to grounding at the amplifier end only. Some fellas use the type of connector on the patch cable (barrel vs. flat) to indicate which way round it goes.

> How about the pickups.  Those big beautiful coils will pick up everything
> from TV to flourescent lights.  Do you have all single coils?  Have you
> tried a guitar with a humbucker?  Your pickups may be crappy (no offense,
> most stock pickups are, if yours are stock they may be.)  Have you tried a
> friends guitar?

I don't believe the pickups are aggravating the poster's problem. It is probably the non-linear junctions on the plugs/sockets. You can have all the wire in the world and it won't be a radio receiver unless you've a means to demodulate it - and that calls for a nonlinearity. There's nothing inherently non-linear about a coil of wire, a cable or the wires inside a guitar.

> I believe you said you also have tube amps that don't do this.  Amen for
> tube amps. I'd stick with those.  Also check your grounds in your guitar

Boy, that sounds an awful lot like what I already said. Dig...

MC

I just think it is a pain in the ass when you have to scroll though all the
Spam to get to the good messages.
And the only was I can delete them is to delete them all.

Your radios don't know what year it is, so there is no reason for them
to glitch unless you drop them on concrete. As for marshall law, those
idiots will only declare marshall law if you idiots behave as if you
need it, so take a deep breath and relax.

Well, it depends what you mean by non-linear.(sorry to be a pedant too).
There is no such thing as a perfectly linear amplifier - all amplifiers have
*some* non-linearity, and musical instrument amplifiers are certainly no
exception. Also, an amplifier which is quite linear at audio is not
necessarily so linear at 1MHz. Say the amp is picking up one volt of RF from
the radio station.  Say the amp produces 0.1% distortion at that frequency.
That's 60dB down, or 1millivolt of audio - quite enough to make plenty of
noise from a high sensitivity input!

Believe me, if you have a really high AM field strength the level of the RF
signal itself will drive the input stage into serious non-linearity by
simply overloading it.
>
 besides, everyone knows all the -best- guitar
>amplifiers don't use transistors. :->

You're right about transistors, of course.  Horrible things, should never
have been invented.  They rectify RF, for a start!

Best wishes

Norman

This radio was purchased in December 1997, and it as been used as a base radio it as never been mobile. It as been chipswitched and it also as a channel guard filter installed. I will also throw in a 13.8VDC 14 AMP power supply with the sell of this radio. I am asking $200.00 US and the buyer pays shipping.
If interested or need more details please feel free to e-mail me.
Thanks

The husband of a family friend died a few years back. He collected CB's, Ham's, antennas, and the like, since the early 50's. I was fortunate enough to be allowed by his widow to root through his radio equipment.

While I was rooting I found an antenna connetor that I was told ( by numerous sources ) never existed. The connector I found may very well date back as far as the 50's, but as I can no longer ask the previous owner where he found it, I am pretty much well "in the dark" as to its origins.

The connector changes a PL-259 screw-on connector to a PL-259 push-on connector. Anther way to put it is you screw your antenna lead onto one end, and push the other end onto the back of your radio.

It has two distinct markings on it - on the side just above the SO-239 threads. One side reads, " SO-239 BM ". On the opposing side it reads, " AVA ".

I would like to find another. This one is still functional but pretty much well worn out.

Any help is appreciated, however minor it may be.

Fella, for what it's worth, please heed this advice. Sell the 122 and get a
SuperStar 3900. You'll have all your channels, a much better taking radio, and
only a few more $ than you'll have in that 122 after adding channels, and 122's
are very low performers.

Then there's the people who don't bother to put the antenna up. The
cell site then tells the phone to crank the power up, most likely to
max.

Heh Heh...

Hey, where can I get a decoder ring?  I want to play!  :-)

Specifically, what is a "pill", and what does the number signify?

And what's a "leece"?

And what's a "bowl"?

Thanks in advance!

<<Well, it is treated as a "hobby' to certain extent, what do you think
about the Petition, and have you read it?>>

Very well written and thoughtfully put together. But it neglects to take into account that the CB service is not now and has not ever been officially recognized as a "hobby" service. That is the big hurdle that the FCC will probably never leap. Its position has always been that CB was designed for license-free, short range utility communications, and that amateur radio is designed for worldwide hobby communications.

From my understanding Dave made will build you as many pills as you can
afford. Many people will say it is easier to go ac because it doesn't
require batteries, rectifiers, it uses less alts and so forth.
I'm sure you know what you want to hear but hear is your answer.

I put my antenna up and try to keep it as far from my head
as I can. Sometimes I can feel the energy. I cut those calls
short. 845MHz is a lot different from 27.2MHz. I have never
felt anything from a CB antenna of mine. I also don't run
1000 watts or more. The antenna is a lot farther away from
your head than with a handheld phone/radio.

I wrote:

I believe that CW was, and is, legal on the Citizens Band under FCC part 15.  Output is limited to 100mw and there is a limit on the antenna length. Some of the Rat Shack walkie-talkies have a provision for tone modulated cw.

Every transistor junction in the amp can potentially act like a diode
and rectify or demodulate an AM signal.

Not to bring you down Prozac, but i have seen a Texas DX 3200 ( 16 pill ) do over 3000+  ( Bird RMS, not on a DOSY ) at under 15 volts.  I don't know what it was doing on a Dosy type meter. Dennis did one for a local lunatic and it did a helluva job till he blew it up.  With an swr of 3, you can't expect a box to hold up too long when being pushed that hard.

What kind of antenna / coax and reflected readings were you seeing ???  Sean
>

prozac 625 wrote in message ...
I ran my 32 pill on one 250 amp leece today with an m400 se driving it in my buddies car (#7). Needless to say there was some major voltage drops but it was pegging the shit out of a dosy 400 watt meter. His 16 pill almost does the same thing but not a full peg like the 32 pill. This tells my he is driving the 16 pill and still has current to spare.....

If you were on the bowl you probably heard it since the BYU was coming back to us for over an hour..

I think that anyone with experience knows that it is all in the complete system setup and installation and not just the amplifier used.

I have some locals that will only use X-Force, some that will only use Dave, some for Pirate, some for Foxie, some Dominators and some for Texas. They all have the potential to walk tall, but some are more consistent and stable than others.

If you want to see if your box is stable, try the following simple test. Drop the carrier level down on your box and check your swr BETWEEN the amp and the antenna. This means that you need a meter BEHIND the amp and a radio's swr meter will not work. Then crank the carrier up and re-check it. If it skyrocket's either way, your box is probably unstable and oscillating.

Most "competition" amps will go berserk at low drive levels. I need not mention any names, but some are WAY worse than others. The boxes that require TONS of drive are typically the worst offenders. Sean

Bird has offered digital read-out for years. The only difference that i see is the personal ID number. Sean

New!
Digital Bird reading meters,
Yes! They are here and now ready to order!!
Each unit is hand-built by the "Master" himself,
This is one item that you will not see duplicated by the copycats.

This is one TRICK item. With this you can read forward , reflect and SWR readings. It has a protective alarm built-in to protect you from exceeding the highest SWR that you have programmed, plus, each one is programmed with a personal ID # to prevent up-grades or repairs by unauthorized persons. Man this thing is FAST! No more slow reading analog meters and counting all of those little lines to see your watts! Digital reading is instant and clear! This can be used in your home or "Your Long-nose Suburban" and is capable of reading from 1/8 to 100.000 bird, RMS or peak! Call now to place your order!

==================================================================

Of course its a davemade coming soon pics to follow.

After thinking about it, your probably right.  While your math is correct, I assumed that you were running a driver, radio and the vehicle off of that 250 amps or so.  I didn't know that you were talking about having that one alternator dedicated  to just the big box.

Your efficiency percentage is probably low too though, as we are talking Class C, not A or AB.  I would also have to assume that your hitting the 16 pill pretty good to see those numbers.  Sean
>

PowerStation <8675309@aol.com> wrote in message ...
Thats the only type of meter I would use. I can hold around 1800/2000 with a 200 amp leece holding 16 volts and at the very least around 2400/2500 with 1-250 amp alt on the 16 pill alone, the peak watts are there as well. I don't see where this is a outragous claim I didnt say i was holding 750 with a 2 pill or anything like that. 250 amps x 18 volts= 4500watts @ 55% eff = 2475 watts I may be on the low side with 55% . And  you are not even taking into account the battery power. Thats what happens when you have an amp that is fairly effiecient.

Gary, this is not to mention that the TVI filter mentioned typically increases the swr / whacks up the impedance seen by the radio.  This can actually cause the radio to produce greater amounts of out of band emissions, making even more TVI / interference problems.

Just a side note here.  ALL tvi / low pass filters HAVE to be earth grounded to work correctly.  The only filter that i have seen that will work without grounding it is the CPI, which was an absorption type filter and different than any other made.  A good idea is to install your station following guidelines as published in the ARRL handbook.  This will minimize problems to begin with.  Sean
>

Gary Danaher wrote in message <385181F5.A4148A6B@flash.net>...
The television coax is supposed to be a sealed system. No rf gets out and no rf gets in. By putting a pass filter in the coax line, you will accomplish nothing if the coax was installed correctly. More likely, you are seeing fundamental front end overload, meaning that that your rf signal is getting into the TV directly through the case, or secondly, that the rf is coming in on the electrical line.  I presume that you are operating an unmodified radio with legal power and that it is grounded properly? For starters, you need to see what can be done in your own home to clean up the tv reception. For the stereo speakers, modify the length of the wires running to the speakers, and it should improve the situation because the wire will no longer be resonant on that frequency.

actually a 122 can be quite a performer if its done right and paired with the right mic...your local tech will probably throw a channel "kit" in the radio,the labor is very simple,so look at the prices of the channel kits (http://www.bills2way.com)for example,  and add $15-20 to the price of the kit....73's

About once every 5 years I grab an updated copy of the ARRL
Handbook. It's now grown to something like 1000 pages and is
reat source covering a wide variety of electrical and electronic
information.

It also includes a chapter on radio interference, with the
notion that amateur radio operators have bpth a legal and a
moral obligaion NOT to interfere with other services, and
instructs radio amateurs to assist in the elimination of
interference problems, even if it is not their fault.

The LA 900 is the same unit that used to be called TX 800.  The Input drive is
6 watts or less.  The max current draw is around 70 amps.  The LED that says
heat comes on if the amp reaches 175 degrees or hotter, lets you know to let it
have a breather.

Sec. 95.412 (CB Rule 12) What communications may be transmitted?

(b) You may use your CB station to transmit a tone signal only when
the signal is used to make contact or to continue communications.

(Examples of circuits using these signals are tone operated squelch
and selective calling circuits.) If the signal is an audible tone, it
must last no longer than 15 seconds at one time. If the signal
is a subaudible tone, it may be transmitted continuously only as long
as you are talking.

and...

Sec. 95.631 Emission types.

(c) A CB transmitter may transmit only emission types A1D, H1D, J1D,
R1D, A3E, H3E, J3E, R3E. A non-voice emission is limited to selective
calling or tone-operated squelch tones to establish or continue voice
communications. See Sec. 95.412 (b) and (c).

Makes no reference to CW or part 15.

|   New!
|   Digital Bird reading meters,
|   Yes! They are here and now ready to order!!
|   Each unit is hand-built by the "Master" himself,
|   This is one item that you will not see duplicated by the copycats.
|
|   This is one TRICK item. With this you can read forward , reflect and SWR
| readings. It has a protective alarm built-in to protect you from exceeding
| the highest SWR that you have programmed, plus, each one is programmed
with
| a personal ID # to prevent up-grades or repairs by unauthorized persons.
Man
| this thing is FAST! No more slow reading analog meters and counting all of
| those little lines to see your watts! Digital reading is instant and
clear!
| This can be used in your home or "Your Long-nose Suburban" and is capable
of
| reading from 1/8 to 100.000 bird, RMS or peak! Call now to place your
order!
|   ==================================================================
|   Of course its a davemade    coming soon pics to follow.

Let me try to explain the whole thing. My friend has a Lincoln town car with a stock electrical system for his m400se and a leece 250 with the two 8 volt batteries for his 16 pill. He has two coils on the car These two coils are tuned with an mfj meter every time we park some where for keying purposes. Many times we get the meter to say 50 ohm at very low swr. My friends coax is belden 9913F same coax I use. With Teflon insolated pl259's.

We replaced his 16 pill with my 32 pill and on his dosy 4000 watt meter it dead keyed over 3000 RMS. He have a voltage meter in line that is pretty accurate since I calibrated it with a scope. The 3000 watt carrier dropped the system from 18 volts to 16 volts. @ this point we backed the dead key to about 1500 - 2000 and let it peg the 4000 meter with modulation. He kept the rpms up and the voltage meter fluctuated a volt or two..

This voltage drop does not happen with his 16 pill. and the dosy meter is just a few watts from being pegged like my 32 pill did.

So does my friends 16 pill I said it almost pegs the 4000 meter this means
it clears the 4000 mark but doesn't hit the wall like my 32pill made it do.

I repair guitar amplifiers as a full time job, and I'm also an ex broadcast engineer, so I might be able to help. I'm familiar with most of the amps on the market today and their shortcomings. Tell me the make and model of your amp and I might be able to provide more detailed info.

Most mass-produced guitar amps today are loaded with poorly soldered joints. I've seen these detect RF in the AM broadcast band on multiple occasions. One reason why AM BCB interference is most common is because the op-amps and transistors used in most solid state guitar amps have a reasonable amount of gain in the 1MHz range.

With all due respect to MC 10kW Jesus, most guitar cables are unbalanced, with a single conductor plus shield.

You won't find part 15 regulations under part 95. Part 15 deals with low power devices such as unlicensed transmitters on the AM or FM broadcast bands and 100 mw walkie-talkies on 27 Mhz as well as "unintentional radiators" such as receiver oscillators and industrial equipment.

There are several "license free" bands covered by part 15 including the 530 to 1605 Khz AM broadcast band, 27 Mhz for walkie-talkies and remote control, 46 and 49 Mhz for cordless phones, and the 900 Mhz cordless phone frequencies.

This base works very good, it has AM, USB, LSB. SWR meter, and
modulation meter, it transmits and receives %100. it`s missing a chrome
rectangle type thing on top (just cosmetic) but thats not a big deal.
It comes with a stock mic. This base was probably built back in the
80`s, this thing is built like a tank !, weighs at least 10 lbs.
They just don`t make them like this anymore.

It looks very good, and works great !
The price is $100.00 + $12.50 for shipping, if you want postal insurance
on it, that will be $2.00 more.
Sorry no C.O.D.`s or personal checks.
a U.S. Postal money order will work.

If your interested, please contact me at;
max_it_out@webtv.net
sincerely

Helly Tony:  I fixed a Pres Washington once, with no audio AM transmitt
modulation. Found the main modulation pass transistor bad. Radio Shack
had a replacement. Its the transistor that the audio drives for AM, and
has the 12 volts goinbg thru it for AN only. Give this a try.

Jay in the Mojave

I've got the following equipment up for sale:

1 - RCI 2950 10-meter radio w/ 11-meter modifications
1 - 25W->250W linear amplifier, 3 settings, with receive preamp
2 - 1000W capable "penetrator" style antennas (one tuned at 29Mhz,
one tuned at 27.500 Mhz, easily retuned) magnetic mount.
1 - 6 ft. Length RG-8 Coaxial cable between amp/radio
2 - RCI-2950 style power cords.
1 - Astatic Road Devil power microphone with RCI connector.

A nice mobile station to be had, or maybe even a base with a little
work. Everything works really well. I'd like $400 for the setup.

For those unfamiliar with the RCI-2950 radio:

25W all mode (AM/FM/USB/LSB/CW) radio. With modification it
will transmit from 26-32Mhz continuously. Has features of most
10-meter only rigs, with a few extras like a roger beep, splits,
memories, and channel or frequency display.

There are many other modifications for this rig, and it is quite
commonly available on the net or from Amateur Radio dealers.

Please respond to cwbuckle@mtu.edu

do
>over 3000+ ( Bird RMS, not on a DOSY ) at under 15 volts. I don't know
>what it was doing on a Dosy type meter. Dennis did one for a local lunatic
>and it did a helluva job till he blew it up.

Man Sean! Dennis did some numbahs to that box! Geeez... My DX3200 only saw 1600-1800 BIRD RMS at 15vdc. Well, I guess I'm satisfied with that though. No need to send the box to the pump and burn-up later.

Another thing, 625? Get a Bird. Sometimes those PEAK Reading meters don't usually read accurately (even in RMS). Thats why I junked my DOSY and got the BIRD. But then again, each to his own. My couple of Abes...

137... back out!!!

Correction...

I had said the AM interference was audible regardless of whether the guitar cable was plugged in... I goofed. It only happens when the guitar cable IS plugged in. Sorry! But I HAVE tried different cables (plus all of the cables work fine with my other amps), so I'm pretty confident it isn't a cable problem.

According to the majority of the advice I've gotten, I should use a capacitor somewhere near the input to bypass the RF to ground. My next question is should I use the bypass capacitor on a transistor/op-amp in input section, or should I use it on the input jacks themselves. The latter seems easier (especially since I don't have a schematic), however I read in the amp's owner's manual that the main instrument input is able to "sense" either a magnetic or piezo pickup (i.e. instead of requiring separate inputs). If I use a bypass capacitor on this input, am I going to throw off the input's "sensing" ability?

Also, the amp has an XLR jack/input for a mic in addition to the instrument jacks. Can/should I use a bypass capacitor on the XLR jack? (Although I'll say the AM interference when using just a mic in the XLR jack is minimal compared to when plugging something into any of the instrument jacks).

Thanks again to all for the help so far.

Dave

> >
> > Most mass-produced guitar amps today are loaded with poorly soldered joints. I've seen these detect RF in the AM broadcast band on multiple occasions. One reason why AM BCB interference is most common is because the op-amps and transistors used in most solid state guitar amps have a reasonable amount of gain in the 1MHz range.

*IF* (big if) the radio is tuned up and putting out a good
clean/solid signal, it's value approaches $300 (IMHO).

The real value of such a radio is that If I bought it from
him at his asking price ($300), and turned around a year
later to sell it and only got the $200 - 225 you say it is
worth, I'd still be better of than if I bought a $300 11 meter
only base. What I am getting at is the value of this radio
is pretty much fully depreciated, this radio will hold this
value into the near-term future.

Sean, I have seen this as well, if you ever see this on an amp that is
biased with any voltage on the base of the transistors, that's when you
really worry, it seems to me that on some of the amps the reason it does
this is because there is not enough voltage present on the base of the

transistors for them to fully function, in some cases it is like not all of the transistors were "keyed up". I have seen people attempt to fix this problem by redoing the keying circuit so it required more key to pull in the relay, therefor applying more RF voltage on the base of the transistors at the time of the relay making, They simply hid the problem instead of fixing it. Also a lot of the guys that repair these amps don't have a scope, or the scope they use does not read very high, say 20 or 40 MHz. My scope is 275MHZ, combine that with a spec analyzer and it is hard "hide" a oscillation problem.

I had a hard time stripping the mic wires on my D104 with wire cutters
once. Kept cutting them off instead of stripping them. Now I melt the
plastic off the wire ends with a soldering iron when switching plugs. No
more headaches!!!!

Don't do it!!!! Don't think about it either!!! Don't even spit a word of modifying CB's or else the evil people will come. El Chupacabra (saw it on X-files re-run lastnite) is everywhere (the not so friendly HAM's).

Don't say I didn't warn ya!

137... back hiding from the "El Chupacabra"(EEEEEEEEEEEEEEEEKKKKKK!)

>Ham is right next door. Martin N5PZJ

Why not, Martin N5PZJ? Why can't the FCC change the rules and make 27 MHZ a Worldwide Communication Band? Like I said before, they sure as hell can take away CODE to attain a lesser form of a HAM Ticket. Now wouldn't that be a major change that old timer HAMs tried to stop?

HAMs, you too Martin, are so narrow-minded and set in your ways that there is no more room for change. Let loose a little and relax your shoulders. Otherwise, strain your muscles and keep the tension within because no matter how hard you try, no matter what rules are going to be made (or lobbied) by you HAM's for CB'ers, the problem will never go away. For every one CB'er busted for running more than 4 watts on AM and 12 watts on SSB, there is 5-10 newbies to take their place. Learn it, live it, deal with it! Fact of life.

I'm done.  I'm never coming back to this thread.

    If I'm not badly mistaken, Ham rigs have been using that scheme
for many, many years. I figure these circuits came around about the
time when small signal diodes became mass produced in repeatable
quantities.

    I think I need to disagree with you Jim.
    The average CB is using +/- 3 to 6 khz. if everything is clean.
Much more if there's an overdriven stage or an poorly designed amp.
(Hi IMD)
    Nowadays, the trend is to migrate towards 2.5 khz deviation in
commercial service. Most new systems installed today are using
narrowband FM of the 2.5 khz variety.
    Anymore, you can have just as many or maybe more FM systems
running in the same space as the AM rigs.

It appears you are using Outlook Express.... Do this from Outlook Express:

```
Tools
   |
   |
Options
   |
   |
"Send" Tab
   |
   |
"Settings" beside "Plain Text" under "News sending format"
   |
   |
"Automatically wrap text at  ###"  Try to set it from 70-76
```

Thats about it... that is IF you are using Outlook Express v.4.72.31 +

Take care.

Hank

Would your area happen to be in the US?  I don't have a linear, but I
have a vehicle with a winch, so one of those might be handy.  Do you
know if they're available for American cars?

Thanks!

-Jeff

The problem:

Solid state amplifier are prone to this behavior because of the non-linear behaviour of the semiconductors at the front end preamp.

I bet if you put your finger on the tip of the plug you hear the AM pretty well.

Solution:

-Don't bother with inductors because the input impedance is too high.
- Don't bother with a line filter as the noise is more than likely coming from the input.

Put a 4.7k resistor in series with the input then a 100pF ceramic capacitor to ground.  Keep all component leads short and mount it close as possible to the input socket.

```
Tip of socket
*----- 4.7k ------+---- to rest of amp
                            |
                         ___
Input                  ___  100pF
Socket                 |
                            |
*-----------------+------
Gnd of Socket
```

I  guarantee this will solve the problem!

Regards
Rob

Thankfully, Tim, the days of hashy switching power supplies are winding down. If you stick to a reputable brand name, that is to say not a "hobbiest quality" one, you should be in good shape. Switching supplies generate maximum noise when they are generating maximum current. In your case this'll be Tx. The hash noise is very unlikely to have any effect on your transmission. It is the noise from the supply getting back into your Reciever that will cause grief. I like Astron linear power supples, but I don't trust them to make a decent switcher. I repaired one the other
day that used a 556 timer for the switching function and the threshhold of conduction on an NPN transistor for the "reference". It works, but this design is about 20 years out of date now. I would recommend something from the folks at ICT. Very good value, reliable, specifically made for two way radios and they have models for all the current you'll ever need - up to 100A.

I am not affilated with ICT in any way.

MC

And an AM signal with a 3kHz modulating signal on it is 6kHz wide so...... I'm having a hard time being convinced that AM is more spectrally efficient than FM.  :->

Hey - I park in a garage every day, so I can't leave my antenna mounted to my roof (low clearance). It is a Wilson 1000 mag mount, so I take it down and put it in the back of my SUV, which means it lays on its side for a few hours a day. Then I put it back at the exact spot where it was previously. Does putting the antenna on its side like this affect its performance?

On another note-
Are there any good CB clubs that operate in the San Diego, CA, area? If so, when and on what channel?

I had one.  Got all the CH's including 10 meter.  I talked 15 miles on 27.455 LSB standing in the bed of the pickup...  Great little handheld. Sucks batts down fast though...  Do not ever key it up with the charger plugged in.  If you do you will pop the diode in the battery pack and render it useless...

My 32 pill means it has 32 2sc2879 transistors made by Toshiba.

The driver transistors can also be called pills witch often causes confusion to the newbie.
Example: a 5 Pill does not have 5 2879's it has a 2290 driver and 4 2879's..

You will find that it is easier to say you have a five pill then to say you have an amp with one 2sc2290 transistor driving four 2sc2879 transistors made by Toshiba.

Like when you say you drive a car you don't say you drive a vehicle driven buy a motor that generates power by internal combustion that forces the pistons to go up and down spinning the crankshaft hooded up to a torque converter going in to the transmission that is properly geared to turn the drive shaft that works the rear differential causing the back tires to spin at the same time if you have a possi rear.

I have had both the A99 and the IMax2000 and am running the IMax2000 right now and have had 10 times better luck with the IMax. Desides being 24' Vs. 18' the recive is mutch better and I can get out mutch further and it is just an all around awsome antenna. I have no GP kit on it either. Just my opinion.

Put it this way the Hams that take it so seriously wont even be on the CB channels so you have not to worry about it.

The only differece between a CBer and a ham is that the CBer doesnt care what the ham does on his frequencies.

Radio Shack still sells one.  Works OK, but not great.

As to manufacturers, there's Avanti, Antenna Specialist, and I think even Larson makes one.

AS has a line they make for Police vehicles. Both single band and multi-band. They are VERY discrete antennas, right down to using the same manufacturers mounting nuts externally to hide the fact that the antenna is a 'custom' so you can't spot an undercover car by the antenna. But they are not cheap.

Thanks for offering to help and thanks to everyone else for their suggestions--I never thought I'd get so many responses! I'll make sure I post the results of my attempt at fixing this thing.

Anyway, the amp is a "California Blonde," made by SWR. I believe it was made in '96 or '97--I picked it up second hand last year. The AM interference is audible regardless of whether I plug in a guitar cable.

hi everybody. ive seen a lot of switching supplies for sale recently and i want to run a texas star 500 in the house. my question is about the rf hash they are known to put out. does anybody know if the hash is just bad in recievers or will it be transmitted in the signal i put out as well? i am really curious about anybodies experience with the 75 amp model sold by coax kid.
thanks in advance tim

When the radio was hooked up backward you blew the protection diode. Go to a radio shop and have a new one put in. It shouldn't cost much.

A Southern Christmas

Twas the night before Christmas,
and all through the shack,
not a thing was a movin',
from the front to the back,

The kids were in bed,
I believe we had nine,
The wife in her curlers,
was lookin' real fine.

A cold wind was blowin',
up the holler it moaned,
All seven dogs on the porch
howled and groaned.

The boys were all dreamin'
of weapons and guns,
for killin' God's creatures,
there's no better fun.

The girls in their feminine
dreams were attuned,
to getting those gallons
of Wal-Mart perfume.

The wife wanted jewelry,
like rings with big rocks,
I wanted my Chevy,
down off the blocks.

Then in the yard,
such a noise did commence,
like something was caught,
in the barb-wire fence.

I ran to the window,
and saw pretty quick,
the man makin' the racket,
was Good Ol' St. Nick.

You may think of Santa,
in your own mind's eye,
dressed in a red and white suit,
But I've got a surprise.

That old boy's an Arkie,
our fair state he won't fail'er,
He married his cousin,
and they live in a trailer.

On Christmas, of course,
a sleigh for his rig,
He hooks the thing up,
to a razorback pig.

He climbed on the roof,
with his bag full of goodies,
He backed down the fireplace,
all dirty and sooty.

Fat legs in his britches,
chubby hands in his mittens,
I admit from the back,
he looked like Bill Clinton.

He turned toward the tree,
His eyes all aglow,
He was a Southern boy,
from his head to his toe.

His neck was a red one,
His shirt said "Light Beer",
there was no red hat,
his cap read,"John Deere".

He left all the presents,
with an air of delight,
Then it was back to the chimney,
and into the night.

He ran into the yard,
and threw his bag in the sleigh,
Then he yelled at the dogs,

to get out of the way.

And I heard him exclaim,
as those pigs took to flight,
Merry Christmas to all,
and to all a good night.....
or maybe it was a "bud lite"

It has come to our attention that a few copies of the Texas Edition of Windows 98 may have accidentally been shipped outside of Texas.

If you have one of the Texas Editions you may need some help understanding the commands.

The Texas Edition may be recognized by looking at the opening screen.

It reads WINDERS98 with a background picture of the Alamo superimposed on the Texas flag.  It is shipped with a Leann Rimes screen saver.

Also note the Recycle Bin is labeled Outhouse.
My Computer is called This Infernal Contraption.
Dialup Networking is called Good Ol Boys.
Control Panel is known as the Dashboard.
Hard Drive is referred to as Wheel Drive.
Floppies are Them Little Ol' Plastic Disc Thangs.
Other features:  Instead of an Error Message you

get a Winder
covered with a garbage bag and duct tape.

Terminology:
OK = ats aww-right.
Cancel = hail no.
Reset = aw shoot.
Yes = shore.
No = Naaaa.
Find = hunt-fer it.
Go to = over yonder.
Back = back yonder.
Help = hep me out here.
Stop = ternit off.
Start = crank it up.
Settings =sittins.
Programs = stuff that does stuff.
Documents = stuff I done done.
Also note that Winders 98 does not recognize
capital letters
or punctuation marks.  We regret any
inconvenience it may have
caused if you received a copy of the Texas
Edition.  You may
return it to Microsoft for a replacement version.

Weather than trying to sound like "RF" Police,  I want to bounce off the group their thoughts on this petition.  Very well written as you said, but as I stated, "The Fcc will never allow hobby DX on 27 when 28 (MHZ) Ham is right next door.  Martin N5PZJ

Hey,

My friend was looking for some info on the Family Radio Service.  He has found that some of the freqs are GMRS also.  He has a 2 watt motorola unit and recently found out that a company  makes a 5 watt unit.  All the info we found says you need a lic. from the FCC.  Does anyone know how you get such a license?  Also, is there anywhere you can buy these 5 watt units?  Thanks, ryan

The last one I bought, 1987 was allready too big for me,
and that index was terrible. I hate dragging out big books.
I still have my nice little 1960 edition somewhere.

Whats the performance difference between the 500 and the 1000? How does
the 500 stack up a against a K40? Thanks.

Hmm, that does sound like a rectifying dry joint inside the amp,
possibly not even in the input stage if the breakthrough is there even
with no cable plugged in.

That was good I loved it......

"COLD as ICE" <icecoldnyc@aol.comICECOLD> wrote in message
news:19991213120654.25632.00000475@ngol02.aol.com...
| A Southern Christmas
|
|  Twas the night before Christmas,
|  and all through the shack,
|  not a thing was a movin',
|  from the front to the back,
|
|  The kids were in bed,
|  I believe we had nine,
|  The wife in her curlers,
|  was lookin' real fine.
|
|  A cold wind was blowin',
|  up the holler it moaned,
|  All seven dogs on the porch
|  howled and groaned.
|
|  The boys were all dreamin'
|  of weapons and guns,
|  for killin' God's creatures,
|  there's no better fun.
|
|  The girls in their feminine
|  dreams were attuned,
|  to getting those gallons
|  of Wal-Mart perfume.
|
|  The wife wanted jewelry,
|  like rings with big rocks,
|  I wanted my Chevy,
|  down off the blocks.
|
|  Then in the yard,
|  such a noise did commence,
|  like something was caught,
|  in the barb-wire fence.

```
|
|  I ran to the window,
|  and saw pretty quick,
|  the man makin' the racket,
|  was Good Ol' St. Nick.
|
|  You may think of Santa,
|  in your own mind's eye,
|  dressed in a red and white suit,
|  But I've got a surprise.
|
|  That old boy's an Arkie,
|  our fair state he won't fail'er,
|  He married his cousin,
|  and they live in a trailer.
|
|  On Christmas, of course,
|  a sleigh for his rig,
|  He hooks the thing up,
|  to a razorback pig.
|
|  He climbed on the roof,
|  with his bag full of goodies,
|  He backed down the fireplace,
|  all dirty and sooty.
|
|  Fat legs in his britches,
|  chubby hands in his mittens,
|  I admit from the back,
|  he looked like Bill Clinton.
|
|  He turned toward the tree,
|  His eyes all aglow,
|  He was a Southern boy,
|  from his head to his toe.
|
|  His neck was a red one,
|  His shirt said "Light Beer",
|  there was no red hat,
|  his cap read,"John Deere".
|
|  He left all the presents,
|  with an air of delight,
|  Then it was back to the chimney,
|  and into the night.
|
|  He ran into the yard,
|  and threw his bag in the sleigh,
|  Then he yelled at the dogs,
|  to get out of the way.
|
|  And I heard him exclaim,
|  as those pigs took to flight,
```

|  Merry Christmas to all,
|  and to all a good night.....
| or maybe it was a "bud lite"
|
|

GMRS does require a license and there is a fee involved.  Almost all UHF business band radios are also type accepted for use in GMRS.  I believe the GRMS "split" channels that are shared with FRS are limited to 5 watt.  Regular GMRS channels are limited to 50 watt, if my memory serves me.

A search on the web under GMRS will yield you with all you need to know about getting licensed.
I have a 16 channel, 4 watt Uniden HT for sale or trade that will work on GMRS if you're interested.

:)  Just remember that "pills" are usually (always) ganged up in
"2"...unless it has a "driver" "pill"....

prozac 625 wrote in message ...
|My 32 pill means it has 32 2sc2879 transistors made by Toshiba.
|
|The driver transistors can also be called pills witch often causes
confusion
|to the newbie.
|Example: a 5 Pill does not have 5 2879's it has a 2290 driver and 4
2879's..
|
|You will find that it is easier to say you have a five pill then to say you
|have an amp with one 2sc2290 transistor driving four 2sc2879 transistors
|made by Toshiba.
|
|Like when you say you drive a car you don't say you drive a vehicle driven
|buy a motor that generates power by internal combustion that forces the
|pistons to go up and down spinning the crankshaft hooded up to a torque
|converter going in to the transmission that is properly geared to turn the
|drive shaft that works the rear differential causing the back tires to spin
|at the same time if you have a possi rear.

I have 3 Hamsticks. Two for more than 10 years.  Dont like most on-the-glass antennas though no experience with yours.

Have 9' 15m whip that I cut the coil out of and mounted home wound "bug-catcher" for multi-band.  Been in the air for 10 years w/no spring either mobile or base.  For 40/80 it gets bent over into an inverted-L with extra 25' wire from end of whip to pulley/mast on the other side.

Also a 9' 2m Co-Linear (9007) w/out spring for 8 years (look out for metal fatigue on fender) w/no breakage

However, I have heard of FG whips break from being hit by flying pebble.

For the price they are quite durable if not disposable.

Got a President Washington that has VERY weak AM modulation.
SSB works fine so I know the final and driver are OK.
I have done all the following already
1. Changed the audio output/modulator chip (although receive audio and PA audio are good except when volume is turned up past about 12 o'clock, it squeals on receive)
changing the chip did not help any of this.
2. replaced the 2 transistors in the modulator circuit (Q34 & Q35).
3. changed or checked diode and electrolytic capacitors associated with
    the Audio output chip and modulator/AM power circuit.
    This thing is about to drive me crazy.
Has anybody out there had this problem and it so what was the fix.
Please don't tell me to take it to a radio shop. I am a radio shop but just can't seem to figure this one out.
Thanks in Advance
Tony

I have read in a few of the Ham publications about the New Top Dog
for the FCC. If his leadership doesn't falter, you can never tell
maybe your plan could help. But how would someone ""police''' the
sunspot cycly??? When I had a CB station w/ mobiles 90% of the time my
range was about 5 miles, on the other hand , I could probably talk to
Aust. and S. America, but that was not the reason for the radios. I
spent a lot of money on Cbs, only to discover what I was really
looking for is inexpensive (in the long run) 2 meter fm, base and
mobiles. The base ant. is about 45 ft, with a range of about 20 miles
simplex to mobil, and about twice that with 'repeaters'.It is
reassuring when my wife and or daughter go into the city,that they
have
away to 'reach out ' if need be.   Just my 2 cents on how to improve
 your CB.

You do need a license to operate on the GMRS freqs with anything over .5W.
The FCC site you can visit for more information is
http://www.fcc.gov/wtb/prs/genmbl.html .   You can buy handhelds from any
business radio company.  Try
http://members.aol.com/crobbinsnc/radioaol.html  for used radio gear, or
http://www.gmrsweb.com/gmrs.html for more info about GMRS and FRS radios
and their respective services.

I was wondering if anyone could tell me the (approximate) relative broadcast ranges for handheld and mobile CB radios. Just to make it a bit more specific, I am considering something like the Cobra 75WXST mobile and the Cobra HH45WXST handheld. Also, with the mobile, I would probably be choosing between an approx 4' antenna on the hood or a 2' antenna on the roof. I am assuming from previous discussion that the handheld would be "worse" and that either antenna I mentioned would be "worse" than, say, a 108" antenna. Just wondering if anyone knew how much worse. Thanks.

DJL

The modification posted by Carl was actually written by me, he took my name off my post and then strated reposting it, and i just used this procedure three weeks ago to modify one of the newer style Eagle Sidewinder 400 radios that i bought. Unless Eagle has changed the radios again....which they just did a few months ago to make the units harder to modify for 11 meters, and so is very unlikely, the modification will still work.

Take off the bottom cover...with the front panel of the unit facing you look toward the front right side of the componant side of the board, you will see a 2 by 3 inch board that is elevated and inverted with its traces facing upward, it is soldered to the chassis to serve as a ground. Desolder the tab...remove the phillips screw and lift the board up a few inches and turn it over and locate Con1. The printing for the three Con1 holes that you need to find is white, cut the leg off a transistor and make a staple shaped jumper that fits in between holes 2 & 3, and after reconfirming you have got the right holes, secure the board so it cannot move and solder the jumper in place. If there is solder in hole 1 remove it, and remember that the holes are reversed when you invert the board as it was before you removed it, so be careful.

DO NOT BUY THE TIPS & TRICKS VIDEO # 9 FOR THE EAGLE SIDEWINDER 400 FROM COPPER ELECTRONICS...AS ITS CHANNEL MODIFICATION SECTION IS OUTDATED AND NO LONGER COVERS THIS RADIO !!

I have a feeling that you are looking in the wrong area of the radio...take another look, remember, its under the bottom cover, where the speaker is at, not under the top cover where all the solder joints are located...but the bottom cover. If all else fails send the thing to me, and i will mod it for you for free.  Damon

AM uses only about 3 to 5 Khz of band width, where FM uses 10 to 15 Khz. In other words, you can have several AM channels in the same space as one FM channel.

While CB channels are normally 10 Khz apart, FM business and public safety channels are 20 Khz apart on low-band and 15 Khz apart on VHF high-band.  In order to use FM on CB you would have to cut the number of available channels in half to provide the same level of modulation. (deviation on FM)

A properly adjusted CB, is suppose to be set for 3 Khz deviation thereby
giving you a
total bandwidth of 6 Khz.
Tony

But anyone with a cable ready TV can receive it if they are close enough?
That would be some cool shit.

hi,i have the following for sale.all gear is in great working condition and all radio's are tuned-up:

1 cobra 148GTL with x-tra channels in hi/low and brt/dim switches..and a 5-tone roger beep in the cb/pa position.radio sounds great and is cosmetically a 6-10 (has 2 holes were switches usd to be mounted on top case and a few scrapes here and there).$100/or $115 with cobra power mic

1 uniden grant LT with x-tra channels (no skips) in cb/pa-hi/low-brt/dim switches..6+/- open clarifier..fully modified..only used a handful of

times..looks brand new with all original accesories (box,manual,etc.)$150

1 PDC-256 internal freq counter..with paperwork and box..good condition.$75
or will sell installed into either the 148 or grant upon request.

1 silver eagle desk mic looks new..works fine..have box.$50

1 cobra power mic $15  looks and works fine.

1 2-tone roger beep board   nice sounding (for a roger beep)  $15

i would likee to sell as package or partly-packaged but will settle for
seperate
buyers..any questions or if you want to work anything out email me at
Jayedie11@aol.com       i will also do any mods or wiring that you need upon
request (although most mods are already done).. prices are negotiable in
package or partly packaged deals.....73's

Agreed!  Specifically:

>>I have a friend I can here on any channel because they are 30 ft from me.

That's too close for me!  Maybe that's why he used the word "here" instead of
"hear"?

>>I talk to him a lot.

If he covered up every channel, I'd talk to him a lot, too! And not too nicely!

>>From what he tells me and what I have seen, the FCC is at his house often.

If I saw the FCC at the house next door even ONCE, I'd be afraid to talk to the neighbor. The FCC seems to hang out over there. No wonder there is no enforcement anymore. They're socializing with this guy's neighbor. He must serve good coffee and donuts. Or maybe it's something else....something sexual? (Gasp!)

>>When they take his stuff, he just goes out and buys more
>

Every Troll slips somewhere. This was BlueDevil's trip-up. When the FCC takes your stuff, you don't go buy more. First of all, if there was a fine involved (Notice of Apparant Liability), you don't have any money to buy more equipment. Second, if you're married, your spouse TELLS you that there will be no more radios. From now on, the money in the household goes for food and clothes and to get the kids' teeth fixed. Oh yeah, and let's do something about the bald tires on her car! Do we love our wives, or WHAT?

Third, and this is very significant, the court frequently bans the offender from owning or operating radio equipment for life, or for a period of years, unless required as part of one's occupation. (A taxi driver still can have a radio).

I sincerely doubt that this guy's neighbor keeps buying more equipment. On the other hand, some folks don't learn very fast.

:Q>QRM
:Q>"Remember when a dead key was when your Morse Code sender was broken?"

Sorry, you are correct.  I didn't mean to link the two concepts
(modes and power) together.  25W is the SSB power output.

The regulations do not apply to exempt transmitters.  In the 11 meter
band, a final input of less than 100mw and an antenna that is under a
specified length is exempt.

It is NOT a CB station - it is an experimental unlicensed transmitter.
Read the regulations that cover such transmitters - the rules are very
explicitly spelled out.

: That would be some cool shit.

No.  As the other person stated - it requires some special equipment.

For one thing, the scan rate is very slow - as is the data transfer rate.
So if you move slightly in front of the camera, the picture smears. It is
best for static pictures - such as a card with your call letters on it.

Sounds like you really have your act together there, Boo.  A scope that does
not read ACCURATELY to at least 125+ Mhz is just about useless for working
on radio gear at our freq's.  Most people don't realize that a 40 Mhz scope
is really only accurate to about 20 Mhz or so.  The frequency that the scope

is rated for is the 3 dB down point.

From my experience, most cheap scopes are severely bandwidth limited and have a hard time making spec.  Once they start to roll-off, they take a severe nose-dive in performance.  For my money, Tektroniks or H-P is the only way to go.  They cost more, but are built 100 times better than any of the others on the market.  They will easily surpass specs and last much longer than any of the budget brands.  I had a quad trace 275 Mhz H-P with digital storage ( very early version, but was still about $20K when new). Turned out that my trusty old Tek 465's gave better overall performance. Gotta love those ugly old antique's  :  )

I can easily tell when someone does not have a scope or does not know how to read the one that they have ( the mass majority of radio shops and "tweakers").  This is very obvious on some radios and especially amps.  Some of these folks are paying guys to "hot rod" or "super tune" their amps by changing part values or adding trimmer caps, etc...  Sure, the power looks impressive on the meters, but it is all harmonics and oscillation.  What they don't realize is that the amp is actually doing LESS power than before the modifications to it.  Besides greatly reducing the lifespan of the amp & pills, they wonder why they have swr problems ONLY when the amp is on !?!?!?!

Your observation about amps with bias going into oscillation is right on. The bias adds stability to the amp.  If it still oscillates, it is a REAL piece of junk or severely out of tune.  The little "blue faces" tend to do this and have come WAY down in quality over the years.  This is not to mention the amps that NEVER were quality in the first place.

The trick about raising drive levels and playing with the keying circuit to add stability is an old one.  Unfortunately, some of these folks take the "back-woods band-aid" approach to designing / building things.  I'm glad that we've got a few guys out here that have enough sense to know which end is up.   Sean
>

-=BOO=- wrote in message <834b7d$k9h$1@nntp4.atl.mindspring.net>...

Sean, I have seen this as well, if you ever see this on an amp that is biased with any voltage on the base of the transistors, that's when you really worry, it seems to me that on some of the amps the reason it does this is because there is not enough voltage present on the base of the transistors for them to fully function, in some cases it is like not all of the transistors were "keyed up". I have seen people attempt to fix this problem by redoing the keying circuit so it required more key to pull in the relay, therefor applying more RF voltage on the base of the transistors at the time of the relay making, They simply hid the problem instead of fixing it. Also a lot of the guys that repair these amps don't have a scope, or the scope they use does not read very high, say 20 or 40 MHz. My scope is 275MHZ, combine that with a spec analyzer and it is hard "hide" a oscillation problem.

<<no matter how hard you try, no matter what rules are going to be made
(or lobbied) by you HAM's for CB'ers, the problem will never go away>>

Rules for CB'ers aren't being lobbied for by hams. The Ehlers Bill and similar
legislation was born from interference complaints by average citizens
fed up with having to tolerate their local 27 MHz splattermeister and getting
little or no action from the Feds.

<<For every one CB'er busted for running more than 4 watts on AM and 12 watts

on SSB, there is 5-10 newbies to take their place.  Learn it, live it, deal with it!
Fact of life.>>

Maybe the problem won't go away, but things could get tough enough so that only hard core outlaws would remain.

This amp EASILY pulls 70 amps if being pushed.  They are a pain in the ass to work on too.  Feed it some heavy wiring and don't drive the piss out of it.  It will last a lot longer this way.  Sean

The LA 900 is the same unit that used to be called TX 800.  The Input drive is 6 watts or less.  The max current draw is around 70 amps.  The LED that says heat comes on if the amp reaches 175 degrees or hotter, lets you know to let it have a breather.

Ford has always made heads that take deep breaths, but they never know how to exhale.  A perfect example is the Mustangs of a few years back (5.0 liter).  Four SMALL catalytic converters ???  Put that on a Camaro and see how it runs !!!  As it is, the 302's KILLED the 305's.

For another example, take the Boss 302 or 351 Clevelands.  They used intake valves and ports as big (2.19") or bigger (2.21" earlier versions) than 454 Chevy's.  Too bad they had horrible dog-legs in the exhaust ports and choked the piss out of power output.  429's and 460's also suffer the same "potato in the tail pipe" exhaust port design.  This does not include the Boss 429 or ( to a lesser extent )the 429 Cobra Jet / Super Cobra Jet designs

Ford also made far more racing parts in the muscle car hey-day's than any other manufacturer.  Take the 427 for instance.  They had the standard "low riser" heads, "meduim riser" heads, "hi-riser" heads, "tunnel port" heads and even "single overhead cam" designs.  Each one used different port and valve dimensions and was tuned for different RPM ranges.

The 351 Cleveland also used different heads for the 2 and 4 barrel versions.
While Chevy changed intakes and lost cam duration / lift when going from a 4 to a 2 barrel, Ford changed heads, port sizes, valve dimensions, etc...
The lowly 2 barrels used 2.05" intakes while the Chevy "race-bred fuelies" on the vette's were smaller 2.02" valves.  The Ford 4 barrels used 2.19" intakes for their 4 barrels and race versions.

Ford also made more dual quad and six pack equipped cars from the factory than any other manufacturer.  In fact, as far back as 1955 you could
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

purchase a V-8 with dual quads and a Paxton Supercharger from the factory an option of the 312 found in the early T-birds).

Just for the record, Fords won more Nascar races from 63' - 70' than all other makes combined.  Here's another one just so that you don't think i'm overtly biased  :  I have owned more than a dozen GM's ( Big block Chevelle SS,  482" Joe Mondello Olds with Batten heads and 8 Webers in a T/A, turbo'd 355" Chevy in a T/A, several 355" camaro's, etc... ).  I still own an old Stingray Corvette.  If it came down to it and i was going to restore another old muscle car though, it would be a Ford.  Just my preference (although you can't deny history).  Sean
>

Matthew wrote in message <38558480.5E78@execpc.com>...
comparing a 302 to a 350 is like apples to oranges... or should I say cherrys to lemons. Try comparing something of the same basic block size like a 351M to a 350...

Pretty much have to agree.  While the 122 can be a decent talker, it is
noisier on RX and is a pain to modify.  You also have to install an "expo
kit" to get channels in it.  On an SSB radio, this means that the radio will
NEVER be properly aligned on frequency for all modes in all the bands.  Save
your money and buy a more worthwhile rig.  Use the 122 as a back-up.  Sean

```

Fella, for what it's worth, please heed this advice. Sell the 122 and get a
SuperStar 3900. You'll have all your channels, a much better taking radio,
and
only a few more $ than you'll have in that 122 after adding channels, and
122's
are very low performers.

I have noticed that the Connex 3300 series radios have gone down in quality lately. They are using cheaper transistors, lower grade capacitors, etc... to keep the costs down.

As to the 4400, i'm assuming that it uses the new style board. Good power and modulation along with killer RX ( maybe TOO good with all of the noise right now) make for a solid radio. Like any of the other "export" type radios, it will need some TLC before going out the door though. Find a competent shop that will ruggedize the chassis and inspect for bad solder joints BEFORE selling you the radio. Make sure you get a good warranty too. Stay away from anyone that mentions "super mod'ing" your radio. Sean

A friend of mine has a mint, and I do mean mint Teaberry Tele T 23 channel base cb radio that is still in the original box with all the papers and foam. I believe this radio was made in the early 1970's. If you have any idea what this radio is worth please email me and let me know.

It even has the FCC application for the CB license with it. I have never seen something this old, in this condition.

I have pictures of it if interested.

Sean,
You forgot the real jewel...
68 1/2 Super Cobra jet Mustang..
428 aluminum head one 4BBL
390(conservative HP)
They did 105 1/4 mile from factory with high speed rear end at like 13 sec.
Put a 4.88 under it and low 11.1 1/4 mile times were there with a only a tune
and hooker comp headers. That was a real factory hauler. Stock top end was
enough to take most vettes. It screamed.
The secret on the 289-302 blocks was to put 351 winsdor heads, larger valves,
mill.40 off the heads to keep up compression, and do the 6250b cam, offy 360
intake, holley 650 dual pumper , accel dist.,headers....400 hp. I did one of
those in a stock 66coupe....Oh, don't forget to upgrade the radiator, it has
to get the heat out.
It was factory wimbledon white with the blue center wires, burgundy interior.
Looked factory stock, 11 discs to stop it. Yes I stole a few Z28's at the
stoplights :-)
51 is outta here................
>Ford has always made heads that take deep breaths, but they never know how
>to exhale.  A perfect example is the Mustangs of a few years back (5.0
>liter).  Four SMALL catalytic converters ???  Put that on a Camaro and see
>how it runs !!!  As it is, the 302's KILLED the 305's.
>

I have used the Hamsticks and ordered them from lake view each time. Yes I did back into something and snap my 40 meter hamstick off right at the base. I got to see how they were made in doing so. Then the price for the hamstick went up to $24 or something like that, an I felt the price a little high. So I had already invented a new mount for my truck, only works for someone with a real bumper, I designed a new mast, made my own single band Hi-Q coil for 40 meters and 20 meters.
The difference between my homebrew Hi-Q (mush less bandwidth) system and the hamstick, is I built the antenna for about the same price, and the receiver came alive. With the hamstick I never had QRM problems mobile, with the Hi-Q system I have to use filtering because the antenna now has real ears not just, for lack of better words, and in Don Johnson's words, "A dummy load on a stick". The hamstick works, and I was impressed with how well it worked for 19.95. But after building my own Hi-Q system, the hamstick is a " dummy load on a stick" for $24.95 plus shipping. If you don't have a real bumper, then the hamstick type antenna is still your only option for low profile mobile work. My antenna is only a foot longer then the hamstick and requires support at the tailgate edge, but the performance was worth it. I run 50 watts PEP

from a TT Scout. For me I always want to own a real bumper.
These are my personal building experiences and comparisons.

With big trucks, and antennas on the mirrors (they can't really get them high enough without getting them 'picked off' all the time) it really does help having two antennas.

It's not so much that they are trying to 'cophase' and get a front/back directional antenna (although if they do get it wide enough, it might help somewhat) it's just that they have this huge metal shield out back they want to get around.

So from a truckers point of view, with a single antenna he has a VERY distorted coverage pattern that IS directional.  Having TWO antennas DOES make it appear, to him, to be more general in coverage.

Besides, is he REALLY going to get those antennas far enough apart to make his pattern all front/back?

Mike

You are correct on the 2.5 Khz deviation for the new systems, however
have you listened to a 2.5 Khz transmission on an older receiver set for
the normal 5 Khz?  The audio is extremely weak.  In fact, the new radios

will have to have extra stages in order to bring the audio up to an acceptable level.

Given the current state of CB radio where AM transmitters are modified to the extreme, can you imagine the temptation to "peak" the deviation on an FM rig? We're talking wide-band here!

Let's not forget about a little guard band here also. With channels 10 Khz apart, the signal can't take up the whole 10 Khz. There has to be some "empty" space between channels to prevent splatter.

While I fully agree that FM has advantages, such as better audio, capture effect, less interference from static and other noise, I can see many problems if FM were allowed on the same channels as AM.

Just my opinion. Thanks for reading.

Was the original poster speaking of the legal definition of CB as a radio service, or was he using the term CB to refer to the 27 Mhz radio band in general?

Perhaps I was in error when I assumed the latter. No, CW is not legal when transmitted from a station which receives authority to operate under part 95.

However, CW is legal when transmitted on the same frequences by a station which is authorized to transmit under part 15.  It is also legal in some other parts of the world which uses the 27 Mhz band for other services.

Hope this clears up the confusion.

Can anyone tell me if they have come up with
an method for disabling the collector B+ Regulation
of TR49/51 and allowing the full power supply
voltage of @ 13.8vdc to be applied to TR44/TR43-56
while in AM mode in the EPT3600-xxx boards?

Regards.

Hi MC,
Thanks for the response.I didn't think the IMAX would be better than the ground plane.However, I was wondering if it was as good or nearly so.It would be soo much easier to put in a tree,because of the lack of radials.I have a tower but am planning to move soon.So I don't want to put up the tower here.I would like to get an antenna in a tree though.The ground plane at 30ft just don't get it.Also at 50or 60ft should I be concerned about lightening?
Thanks much
Rob

A small Georgia Wild Animal Park had acquired a very rare species of gorilla. Within a few weeks, the female gorilla became very difficult to handle. Upon examination, the park veterinarian determined the problem. The gorilla was in heat. To make matters worse, there were no male gorillas of the species available. While reflecting on their problem, the park administrators noticed Ed, a part time redneck intern, responsible for cleaning the animals' cages. Ed, like most rednecks, had little sense, but possessed ample ability to satisfy a female of ANY species. So the park administrators thought they might have a solution. Ed was approached with a proposition; would he be willing to have sex with the gorilla for $500. Ed showed some interest, but said he would have to think the matter over carefully. The following day, Ed announced that he would accept their offer, but only under three conditions: "First", he said. "I don't want to have to kiss her. "Secondly, you must never tell anyone about this." The park administration quickly agreed to these conditions, so they asked what was his third condition. "Well," said Ed. "You've gotta give me another week to come up with the five hundred bucks."

Hey - I park in a garage every day, so I can't leave my antenna mounted to my roof (low clearance). It is a Wilson 1000 mag mount, so I take it down and put it in the back of my SUV, which means it lays on its side for a few hours a day. Then I put it back at the exact spot where it was previously. Does putting the antenna on its side like this affect its performance?

On another note-
Are there any good CB clubs that operate in the San Diego, CA, area? If so, when and on what channel?

I can easily agree with Mr. Hall. I will go a step farther in saying it will help if you must use a linear. If you're running one of those "near class c" amps then this will minimize the distortion and resultant products leaving your amp. Hence, the rfi is minimized or eliminated. If you're running a decently biased amp but feel the need to overdrive it on voice peaks then this will help as well because you won't have to back the carrier off to get more swing i.e. headroom and you wont be overdriving the amp into distortion without the voice peaks. Hence, less distortion and less distortion products being transmitted.
BobC.

I believe that if installed right and the equipment is right, modulation kept at a respectable level, you could get away with a small broadcast station, but a lot of that will depend on the neighbors equipment as well. A lot of computer speakers with built in amps for instance, have roughly a 9' wire feeding the speakers, hell my speakers had 6 wires, 4 to the speakers (5 speaker system) 1 to the volume control and the power wire...all of these were 9'2" long, what a joke. Man you could bleed on those speakers with a walkie talkie in the front yard. A handful of .01's and a handful of ferrite beads and it is now bullet proof. I wish some of the equipment built in this and various countries would get the same treatment, maybe we would not have such a problem, the government had to let employs go because of the budget, no wonder with all the complaints, and to think that this probably could have been cut in half if they (FCC) would just enforce the laws on the filtering required on the electronics nowadays.

Cleaner as far as switching distortion, but not cleaner
as far as harmonic and parasitic content or AM audio
signal quality since there is no information being
conveyed at the crossovers.

> The majority of "no bias" amps typically run into problems in
> this area due to the different levels of "gating" involved and their various

> gain curves.  The more pills involved, the bigger the variance and the
> problems. With no bias amps, one transistor might be fully on while the
> other is on the edge.  Talk about an imbalance in output !!!

If the drive signal is not split equally there will be an imbalance regardless of the level of bias.  Bias and the input drive signal are separate entities.  You're more likely to have an imbalance with a biased amp because the bias to the different pair can be unequal.  That can't be a problem when all the transistor bases are DC grounded.

> As to the Blue Faces, they are the same ones.  I have had MAJOR problems
> with the 450's and don't recommend them at all.

I think the 450 is a good amp and have never had any in for anything other than the usual abuse-generated problems.

> All of those amps use
> little "weasely" relays that don't hold up well.

I agree that the relays are small; however, I've only had to change one, and that was one that was defective right out of the box in a 225.

> This is not to mention the
> complete lack of quality control.  I have had brand new amps come in that
> had parts that were not soldered in, pills that were not properly seated,
> etc....

I've never seen a line of amps that was more consistent in its quality.  Other than the 225 mentioned earlier that had a bad relay, I've never had a problem with any of them coming in with problems.

> If you want to see these amps get REAL squirrely, put a metal lid on them
> instead of the plastic lid.  There's a reason that Otis went to the plastic
> and it wasn't strictly a matter of economics either.  I know that Dennis has
> experienced the same problems that i have ( not that this means i am right
> and your wrong ).

I remember corresponding with Dennis about that. He told me that it was a different brand that bought parts from some of the same sources. I think he said the brand was "Red Devil" or something like that.  I've tried the metal lid thing in the past and didn't notice any difference in performance.

> I used to like the blue faces before they were known as blue faces.  That

```
> basic design has been around for a long time.

     I remember the old Palomar Magnum Series amps.
     I don't see the new ones as being any worse
     overall.  They could use bigger relays; but,
     in my experience, relays are an expected
     problem area regardless of which ones are
     used.  Running the bias in on the input
     signal isn't the best way to go, but the
     mod I mentioned handles that painlessly.

     As to your addendum in the next post about
     Texas Star being your favorite produvction
     amp, I tend to agree that Texas Star is a
     good choice.  However, they too have their
     minor, irritating issues that make them less
     than the only and always best choice.

Oftentimes, setting it for 70 or less is better.

Or, you can do like I do and just hit "return"
at a convienient place where you know you're
not going to run past the screen edge.  That
technique works particularly well when responding
to other people's posts.  Tabbing out (like you
see here) is a nice touch as well.  These extra
keystrokes may seem like an unwanted hassle, but
once you're used to doing it you don't even notice
them anymore.

Overdrive.  They're only 2 watt pots.  They
are especially susceptible to overheating when
set to a low resistance position that's not
zero resistance.  In other words, when they
are set to almost maximum but not quite.

This would not work, because as you put more RF into the amp and the transistors fully "switched on" then you would really have an imbalance.

Man that would be scary, to see enough RF in to burn up a balancing resistor, yet not be enough to "switch on" one of the transistors, especially if all the transistors show good.

I also run a Kenwood TS440SAT to do this.  That type of radio has to be kept
at near 100 percent audio just because it sounds like shit when overdriven.

When a real 11 meter radio comes in the house, bye bye to the amps.

The transformers are rated at .6KVA, so keep the carrier in the 400 watt
level, and they will last forever..

Same thing with the SB220 and 221.

If it looks "choppy" on your end, try expanding your program window.....
Just a suggestion...    Depends upon personal preference.  I know from my
pre MCSE years as a computer consultant, that most open their "readers" to
full window.  Though if "compatibility" is a concern, then set your wrapping
at 30-50....

Bill Eitner wrote in message <38585AD5.FF0C1651@netzero.net>...
|Sean wrote:
|>

|
| Oftentimes, setting it for 70 or less is better.
|
| Or, you can do like I do and just hit "return"
| at a convienient place where you know you're
| not going to run past the screen edge.  That
| technique works particularly well when responding
| to other people's posts.  Tabbing out (like you
| see here) is a nice touch as well.  These extra
| keystrokes may seem like an unwanted hassle, but
| once you're used to doing it you don't even notice
| them anymore.

I have done it..  To prove a point.

Use Motorola devices and put a standard yellow dot device on one side of the 2 pill.

In the remaining 3 holes, put double dot black devices.

The gain of the double dot black is so much higher that it will begin conducting WAY before the rest do.

There.  Done.

Well, I'm not an engineer nor do I normally repair guitar amps. However I do think I have an answer for you.

Apparently your inputs are balanced according to what I think I read while skimming through the posts.

I suggest that you install, at the jacks, a capacitor across the balanced part of the jack or input. This doesn't mean to chassis ground necessarily although this may be a second option. You'll need to determine which two pins are the input legs in each plug/jack combo.

What you'll be doing is eliminating the difference of potential across the two input legs. If there's no difference in potential then there's less chance for the input op amp or transistor to become biased into becoming a rectifier. By placing the cap across these points you've made sure that the rf voltage is pretty much equal on both legs.

The value of the cap will depend on the frequency of interference and the input resistance of the amp. If these are hi impedance inputs then I would start with a 100 pf. cap. You may need a higher value which you can parallel across any other caps there.

You don't want to go too high in value as this will start to roll off the high frequencies of your guitar or mic.

If this helps but doesn't eliminate it completely then you might also install a cap from either side of the one you put across the

legs, to the chassis and see if that improves things.
    Unless you are really unlucky this should work. If it doesn't
then you might invest into a shop to "rf proof" your amp the best
they can.
                                I wish you luck.BobC

BobC writes:

    There is a time when the rigs' carrier is going to be off during
modulation when not limited to less than 100%. negative modulation.

Not unlike SSB, when the drive gets below the turn on voltage of the finals there will be no conduction in the transistors. When the drive starts to rise, it must pass this breakover voltage to get the transistors conducting again. At this point you have crossover distortion as Sean said.

So, in essence, there is a part of the information lost in the crossovers when not biased right.

BobC

Subject: discussion list for those into military radios
From: Patricia Gibbons wa6ube@ix.netcom.com
Date: Tue, 14 December 1999 10:32 PM EST
Message-id: <38570BE6.4033@ix.netcom.com>

For those who may be interested, there is a discussion
list for those who like to collect, restore, and
especially, operate military radio communications equipment.

This list was started back in august and now has
170 subscribers..

see:

Community email addresses:
Post message: armyradios@onelist.com
   Subscribe: armyradios-subscribe@onelist.com
 Unsubscribe: armyradios-unsubscribe@onelist.com
  List owner: armyradios-owner@onelist.com

Shortcut URL to this page:
<http://www.onelist.com/community/armyradios>

Please pass this info along to any who may
be interested in this facet of the hobby...

Thanx

Trish

Well, I just had to add my two cents.  A long time ago (1968) I was running a Utica TC3 into an 80W amp with a super-magy omni on my roof.   Clean, yeah probably but what you are all missing in one little known fact about AM and simple detection of AM.  ANY bi-polar or bi-metal device can become a simple AM detector!  Even a phonograph (the vinal type for you young punks that never saw a vinal record).

The next day after the linch mob was gathering outside my front door, I decided to dismantal the entire setup. The FCC was a bit more active in those days. For the record, I was heard over telephones (60's vintage, not this new electronic wireless stuff), phonographs (vinal record types :-), AM radios, and TV (first harmonic of 27MHz is right in the bandwidth for TV channel 2 I think; I guess I wasn't that clean :;)).

Anyway, does anyone remember those little plastic radios with an earphone connected to a device with only a 3" antenna, and no batteries? You tuned it by moving the wire up and down out of the device. If the broadcast radio station was stong enough, a simple diode was all that was necessary to detect the singnal. You don't even need a diode either. With enough power, a solder joint joing two dissimilar metals inside a phonograph will do the trick.

John

Thought you might find this interesting.

Where have you put your antenna? Have you tuned your antenna? Where is it with respect to your car radio antenna? What have you attached the power leads of the radio to? What condition is the electrical system in your vehicle in?

I'll go along with this. For those that don't know, this is an active means of demodulating an AM signal rather than a passive one. Very useful if the station you're working is getting their signal severely twisted and faded by the propagation conditions.

> - At least a dual-conversion superhet not only for AM/FM

>   perused seem to only have single conversion for SSB, w/
>   product detection (SSB demod) occurring at 10.695MHz.

I disagree. It is commonly held that single conversion receivers are the best for SSB work. The selectivity is accomplished entirely by the Xtal filter. So profoundly so that additional conversion stages can only add noise. If more gain is required, to make it more sensitive, this can be easily addressed without adding another stage of conversion.

> - Various bandwidths of *crystal* filtering at the 1st &
>   2nd IFs. Should have AM narrow, AM wide, SSB narrow, SSB
>   wide and even a few narrower positions for CW.

I guess we are talking about those 10m rigs here really. To my knowledge, SSB is narrow-band by default so I see no point in making it narrower. I do agree that some SSB receivers have less than excellent selectivity though. I've never heard of narrow-band AM. Given that the the average bandwidth is going to peak at 6kHz, I believe it prudent to have the filtering designed with that in mind. If it were SW broadcasting that you are into, them I could justify a slightly wider filter. I don't believe that there is any broadcasting in this part of the spectrum. Well, there is in a sense but let us not go there right now. :->

> - Variable passband tuning of IF so that offending junk on the side of a signal can be positioned outside the IF passband.

Hmmm...sounds good!

> - Low-noise design in receiver front-end. Some triple-conversion HF rigs apply the input signal directly to the 1st mixer (without being run thru any RF amp stage) for better noise performance.

There are different schools of thought on Rx design. The best all-round I've seen is moderate amplification, heavy filtering and then mixing down with relatively little filtering.

> - Use of a multiloop PLL frequency synthesizer. Single-loop PLL synths with small channel spacing steps (say, 10kHz or below) and simple phase detectors create an elevated noise floor that surrounds, if not buries, a weak signal. (It's even worse in crowded conditions.) Smaller step sizes (1 kHz or less) are even worse! Instead the main PLL should have large step sizes and be mixed with or driven by signals from another PLL or DDS (direct-digital synthesizer). Esp. for a single-band radio, a CPU-controlled DDS driving a PLL synth like an MC145151 or '171, set up with large steps in the main synth loop, would be great.

A man after my own heart. The MC PLL ics aren't inherently inferior - but the loop filters in them are. I've worked on a design where we created an elaborate loop filter outside of the circuit and achieved admirable performance. Were able to cover copious range with the VCO with fabulous noise figures. The design of the VCO was very critical though. If you use a dual-modulous prescaler you can pump data into the PLL that can make use of a lower /R ratio thereby pushing the phase noise higher in frequency - and consequently lower in amplitude. This becomes a software issue now.

> - A PL (CTCSS, Private-Line, etc.) tone encoder should also be included on 10M ham rigs for repeater work (hear that, Radio Snack?) Memory channels should have ability to store unique PL tone values for each channel.

Make that Encoder/Decoder. The last time I checked it was 1999, it's about time this kind of thing should be standard equipment. You'd be hard pressed to find a professional two way radio nowadays that didn't decode/encode CTCSS/DCS (PL/DPL) in stock trim.  If you did, you wouldn't buy it because invariably it would be crap.

> In some ways, we're fairly close to being there.  After all, a
> relatively frill-free multiband rig like an Alinco DX70T or a
> DX77T (both got pretty good reviews in QST) goes for as low as
> $550 to $650 depending on dealer, sale, and version/options.

These are two different markets. Much development cost can be justified on creating hobbyist (ham) equipment. Look at how many of the features of yesteryear are now defunct. This is especially true of the likes of Kenwood, Icom and Yaesu/Vertex/Standard(now). All these companies have professional products with much higher margins and lower build costs that incorporate some of the features trailed on the ham gear.

CB radios are cranked out like dung through a goose in some Chinese sweatshop by some poor slob who makes $3 a day. Incorporating all the lowest cost parts imaginable. If you think that the margins in CB radios are low, carefully study the financials of Uniden. I think you'll be very surprised.

MC is late for dinner - bye!

Also some advice.  Fiesta Island will give you great transmitting

range.  The bay water really helps get the signal out there.  Chatted
with a guy on the island from Del Mar.  Sounded really good.

Good Luck.

It is illegal all right.   I thought 46- 49.999 corless phones were illegal to monitor too.
NOT?
Cordless phones require a better antenna to pick up with a scanner.  A piece of coax with a pin on the end to stick ito the rubber ducky scanner antenna works wonders.
Cell phones are cool.  A lot around 882.400. You can pick them up from a greater distance but can only follow for a short while.  The antenna towers switch off the signal as the cell phone moves from one to another tower.

It's those crappy rubber ducks.  You can't cram a cb antenna into that
short of a package and expect it to work worth a damn.

I have a Midland 4 watt handheld that is easily outdistanced by my FRS radio.  But connect an external antenna, and it's a different story.

TNT's typically have horrible crossover distortion and stability problems. The latest ones are REALLY bad.  Input swr has gotten even worse with them. Had one guy come in with a BRAND new 600 + a few weeks back that kept taking out radios.  The swr going into the amp never dropped below NINE on any stage.  4 watts in gave me slightly over three watts reflected at best case !!!  So much for quality control before it went out the door.

As to the 450 XL's. i had one come in today.  It was a piece of shit.  It showed me appr. 400-425 watts pep at 14.5 volts including horrendous amounts of parasitic oscillation.  It is not uncommon for me to see bursts of appr.

7 - 800 watts out of these amps at times. When i was finally able to get the amp somewhat stable, it was producing about a real 200 watts pep. Pretty pathetic for an amp using 4 Moto 454's from the factory ( in my opinion). He left the amp with me for further repairs. I'm sure it needs a lot more time and TLC than what i briefly gave it today. I would like to hit it with a hammer : )

The scariest thing about this is that the guy was using this to drive an 8295. This in turn drove two 6000's. Talk about a horrendous splatter box.

Between guys amplifying the JUNK that is coming out of their radios / drivers to an even greater extent and amps with horrible input swr's that cause the radio to become unstable and oscillate / produce harmonics, It's no wonder why civilian's complain about TVI and interference.

Not only should the people that build this crap be "corrected" but also the crooks and idiots that pass this type of stuff off to customers as being good quality. It's the mobile stuff like this and the "Varmint" type base amps of yesteryear that have created most of our problems. Combine this with a horribly inept installation ( base and / or mobile ) and you have nothing but complaints coming our way. I can understand why people get upset. Sean

BobC writes:

There is a time when the rigs' carrier is going to be off during modulation when not limited to less than 100%. negative modulation.

Not unlike SSB, when the drive gets below the turn on voltage of the finals there will be no conduction in the transistors. When the drive starts to rise, it must pass this breakover voltage to get the transistors conducting again. At this point you have crossover distortion as Sean said.

So, in essence, there is a part of the information lost in the crossovers when not biased right.

BobC

Matthew wrote in message <38582838.1249@execpc.com>...
Phil,

I only wish ford would put a large engine in the mustang like the 351C
but I would imagine it has to do with fuel economy and emissions. Whats
a pantera? Is that a overseas car?

Yes, It can be hit or miss at a hamfest, you may be able to get one if there are any  around for that cheap you may not even see one at a years worth of hamfests, You also must consider most hams i know don't sell a 1300.00 dollar item for only 300.00 but i am not saying that it doesnt happen. I would wonder what shape it is in as well. With the dave model you can also run your analog meter with the digital watching both dig or analog at the same time.

The Heath's used bigger transformer's as a general rule and would take more of a beating.  The Black Cat's used whatever transformer that they could find at surplus prices.  As such, consistent performance was not a strong point for these models.  As Toll stated, a 400 watt carrier would give extremely long life to the tubes and amp.  I would not push it to beyond 600 watts D.C. and expect it to last a real long time.

In terms of pricing, I have seen these go for well in excess of $1000 USED !!!!  Dick Maresh ( the original owner and founder of Wawasee ) used to get $1200 out of some of these that Dennis had worked on.  Dick had his Pilot's license and would fly in from Syracuse to pick them up and drop them off at Dennis's house.  At that profit margin, he didn't mind making the trip !!!!
Sean

Toll Free wrote in message ...
The transformers are rated at .6KVA, so keep the carrier in the 400 watt level, and they will last forever..

Same thing with the SB220 and 221.

Toll Free

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

## History

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

## The Current Groups

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part

97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at

UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

## Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

## A Few Words on Crossposting

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Nothing to wonder about, Boo.  123 is no longer the "prime mover" in the
X-Force camp from what i have been told and seen.  The latest products
reflect that also.

As the Highlander movie and TV series states:  " There can be only ONE".
That would be the original.  Dave Made.    Sean

As everyone else stated, Texas Star does not make a REAL high drive amp.
This is regardless of what the name says.  Keep the carrier low and the
variable wide open.  Sean

Perhaps I can shed a little light on this statement. First of all, nothing is absolute, so running FM is no guarantee to eliminate ALL TVI problems.

BUT, if you are experiencing interference from RF rectification, which occurs when your signal leaks into a piece of amplifier gear, and gets rectified, and appears as audio on the output (Radios, TV audio, stereos), running FM will, in most cases, eliminate the sound of your voice from coming through the speakers. This is due to the fact that simple rectification cannot reproduce audio from a frequency modulated signal. You will still hear a faint buzz when the station transmits, but that is usually not as noticable as a loud voice booming in.

This is usually the only time that FM will reduce RFI. If your transmitter is dirty, and causing herringbone patterns on TVs, running FM will not change anything. If your signal is just so strong that it overloads the tuner or front end of a TV, stereo, cordless phone etc, then running FM will not eliminate the problem, although your VOICE may not be discernable in the interference.

With this in mind, running FM can help you to get away with some interference. Since your voice usually cannot be heard, it may take neighbors longer to figure out that it IS interference (As opposed to something actually wrong with their TV), and if you live in an area with more than a few radio ops, figuring out which one is the cause will be tough.

THAT is amazing. Where I used to live, I had people complaining while I ran 4 watts! Radio was as clean as a baby's butt, antenna was grounded (And it's not an A99), but I have no control over the cheap unshielded junk that people buy. I find it truly amazing that you can run 3 KW and not get picked up by some cheap radio or phone. Your RF signal is stong enough by itself, even if it is clean, to overcome the weak shielding that passes today. Is your utility wiring underground? That helps too.

<<<<The more pills involved, the bigger the variance and the
problems. With no bias amps, one transistor might be fully on while the
other is on the edge.  Talk about an imbalance in output !!!>>>>

Thats were tuning each individual output transformer with a trimmer across
the top helps out alot but, at the same time can be a detriment as well.
You dont see that method done on that many boxes.

>Because of International Treaty.  For use below 30 megs, above XX watts (the number escapes me at off top of my head) you have to know CW.  Period.<

This doesn't apply to Citizen's Band, however.

We call it "CB" in the United States, but under international treaty it's simply a "land mobile" communications service, no different from the cops, ambulances, or cement truck drivers.

That part of it (not all Part 95 is on HF, remember) is on the HF bands is non-sequitor.  The FCC is responsible for regulating it, but there is NO ITU requirement that land mobile radio services MUST know Morse Code.  Only Amateurs now, whereas only a short while ago it was Amateurs and maritime RO's. The list grows shorter!!

I will g 400 on all of them . . .

Remember that you could also get a 1 knob or 2 knob JB2000 as well

yes overdrive, those potentiometers are only rated for I think 4 watts at
100 ohms.  The dead key into the amp is to high. Need low DC with swing.

I have heard that a handheld CB will not transmit as far as a mobile
CB. It seems from previous discussion that a handheld can be reliable
between 1 and 10 miles depending. How far for a mobile?

I recently installed a uniden Pro510xl, I am having a few noise problems.

1)  I  hear myself talking throw my stereo speakers. Why?

2)  I get noise when I unlock doors, or windows , blower motor, or accelerating, my truck is all power,  Why?

Is there anything I could do to resolve these problems?

Actually I was refering to the authorized CB channels for normal CB
operation under part 95.
Sorry for the confusion here.
I still think it would be a neet idea , and bring something new to the
CB band.
I will probably send a message to the FCC to get their response.
Thanks to alll that replied

Hello.
I'm new to all this "CB" stuff, but I was just wondering what frequency does a mobile Phone operate on as I want to use a scanner to pick up analogy signals from mob. phones?
I know there's a frequency set aside for such devices, can anyone help?
If anyone can help please E-mail me:
Sorcerer671@freeuk.com

Well, I'll only comment on the hardware involved, not about band usage, etc.... However, I personally would like to see the FCC allow low-deviation NBFM (that is, compatible with existing 10kHz channel spacing) use on at least some of CB's 40 channels.

Most CBs & related "10 meter" rigs are, frankly, not really super great radios unless you say "they're good for the price" (True.) These rigs are already a fairly low-cost item (hell, even a Grant XL or Cobra 148 or HTX10 is, what, $120 or $140? I've spent quite a bit more for dinner for two!) with razor-thin margins for the manufacturer, importer, and dealer.

Every little thing is done to shave costs. Since these radios are regarded as "consumer" items, more effort and expense may well be expended on chrome plating or panel backlighting than on improving receiver intermod performance and selectivity or reducing the PLL synthesizer's phase noise.

What improvments would I like to see on good CB or 10M rigs?

- A synchronous detector in AM receive for better weak-signal work.

- At least a dual-conversion superhet not only for AM/FM receive modes but also for SSB (i.e., product detection done after 455kHz 2nd IF). Triple-conversion may even be better for selectivity (although not necessarily for dynamic range). Many of the radio block diagrams I've perused seem to only have single conversion for SSB, w/ product detection (SSB demod) occurring at 10.695MHz.

- Various bandwidths of *crystal* filtering at the 1st & 2nd IFs. Should have AM narrow, AM wide, SSB narrow, SSB wide and even a few narrower positions for CW.

- Variable passband tuning of IF so that offending junk on the side of a signal can be positioned outside the IF passband.

- Low-noise design in receiver front-end. Some triple-conversion HF rigs apply the input signal directly to the 1st mixer (without being run thru any RF amp stage) for better noise performance.

- Use of a multiloop PLL frequency synthesizer. Single-loop PLL synths with small channel spacing steps (say, 10kHz or below) and simple phase detectors create an elevated noise floor that surrounds, if not buries, a weak signal. (It's even worse in crowded conditions.) Smaller step sizes (1 kHz or less) are even worse! Instead the main PLL should have large step sizes and be mixed with or driven by signals from another PLL or DDS (direct-digital synthesizer). Esp. for a single-band radio, a CPU-controlled DDS driving a PLL synth like an MC145151 or '171, set up with large steps in the main synth loop, would be great.

- Main tuning knob operates at finest frequency resolution of say, 1 or 10Hz.  Separate, switchable RIT and XIT controls should be available.

- A PL (CTCSS, Private-Line, etc.) tone encoder should also be included on 10M ham rigs for repeater work (hear that, Radio Snack?)  Memory channels should have ability to store unique PL tone values for each channel.

Anyways, that's my a-bit-more-than-two-bits.

In some ways, we're fairly close to being there.  After all, a relatively frill-free multiband rig like an Alinco DX70T or a DX77T (both got pretty good reviews in QST) goes for as low as $550 to $650 depending on dealer, sale, and version/options.

What improvements would you like to have done to your CB?
Would you want more range?
Would you want more privacy?
Would you want exclusive use channels?

In my Saturn turbo Base I broke the two bulbs for the meters. I have tried many bulbs but had no luck with matching the original brightness.

I tried almost every Rat Shack bulb that will fit I tried Xmas bulbs ranging
from 1.25 volts up to 6 Volts.

Can some one tell me where to get the right bulbs??

>the cause?

The cause in most cases is the amp is being over driven.  To High a dead key feeding the amp will cause one to burn up faster then anything else.  I have had a couple of 667's and never had a problem with the variable, but I never fed them over a 2 watt dead key either.  I have found that they swing alot better with the lower dead key as well.

Subject:  Pissed off

Coming into the bar and ordering a double, the man leaned over and confided to the bartender, "I'm so pissed off !"  "Oh yeah? What happened?" asked the bartender.  "See, I met this beautiful woman who invited me back home, and we stripped off our clothes and jumped into bed and we were just about to make love when her goddamned husband came in the front door.
So I had to jump out of the bedroom window and hang from the ledge by my fingernails!  "Gee, that's tough !" commiserated the bartender.
"Right, but that's not what really got me irritated," the customer went on.  "When her husband came into the room he said, 'Hey great! You're naked already! Let me just take a leak'.

And damned if the lazy son of a bitch didn't piss out the window
right onto my head?"  "Yeech!" the bartender shook his head. "No
wonder you're in a lousy mood." "Yeah, but I haven't told you what
really
really got to me.  " Next, I had to listen to them grunting and groaning
and
when they finished, the husband tossed his condom out of the window. And
where does it land? "My goddamned forehead!" "Damn, that really is a
drag!"
says the bartender.  "Oh, I'm not finished. See what really pissed me
off
was when the husband had to take a dump. Turns out that their toilet is
broken, so he stuck his ass out of the window and let loose right on my
head!

" The bartender paled. "That would sure mess up my day." "Yeah, yeah,
yeah,
the fellow rattled on, "but do you know what REALLY REALLY REALLY
pissed me off? When I looked down and saw that my feet were only SIX
inches
off the ground!!

ICE, ICE, AND MORE ICE MR. ICECOLD BIG APPLE TREES JUST GOT DOWN........

Yes, I am a native...  But now am (unfortunately) in Houston, Texas.

Their are a couple good places to transmit from.

If you want to talk skip, the area of the Gorge (Mission Gorge Rd, east of
Santee) is about the best.

Ask Brass on this newsgroup how we (Dillon) used to sound coming into Oregon
late at night!

Coax quality, connector installation, brand of connectors, Unun installation, ground screening, height above the utilities (no, they are not below ground... Typical on-the-pole utes here), directional antenna (I run a beam antenna), etc., etc., etc.

It is not hard, but not easy, either. If you know what you are doing, it only takes legwork to make a good installation that keeps you, and the neighbors happy.

Incidentally, their was one houses phones I was tearing up at 500 or more watts.... Replaced one phone, and that solved that problem.

Nope... the amp is fairly new and unused and the jacks are in
good shape.  Plus, the interference is present when plugging into any of
the input jacks--main, stereo, aux, and even on the XLR mic jack,
although it's not nearly as bad when using the XLR jack. Thanks though.

If you only want to volt the final, then you cut the DC collector modulated feed (this is what supplies DC to it on SSB also) and put a choke in line and run a seperate lead out the back for the higher volts.

That is the easiest.

Now, if you want the best, I would run a regulator in the radio (3A would be fine) after the hash choke and use that to supply the rest of the radio, and use the higher voltage produced to run the final.

Sean was talking about the individual pairs of transistors...

In that case, where one transistor is on, and the other isn't, you really
see an imbalance, begin to burn up combiners, etc., etc., etc.

Phil,

I only wish ford would put a large engine in the mustang like the 351C
but I would imagine it has to do with fuel economy and emissions. Whats
a pantera? Is that a overseas car?

Matt

Yes, It can be hit or miss at a hamfest, you may be able to get one if there are any  around for that cheap you may not even see one at a years worth of hamfests, You also must consider most hams i know don't sell a 1300.00 dollar item for only 300.00 but i am not saying that it doesnt happen. I would wonder what shape it is in as well. With the dave model you can also run your analog meter with the digital watching both dig or analog at the same time.

yes, very true Sean. but this is his own design /version of a digital
readout same functions different look and style. Just something else to
offer the people as technology is expanded.

Not legal,there are other bands where experimentation and modification
is encouraged rather than criminalized.

Can anyone tell me if they have come up with
an method for disabling the collector B+ Regulation
of TR49/51 and allowing the full power supply
voltage of @ 13.8vdc to be applied to TR44/TR43-56
while in AM mode in the EPT3600-xxx boards?

Regards.

Yes, for about the same as Dave's..

I guess, though, that you get a new unit with Dave's for the same price as
someone elses used unit at the hamfest...

To each his own.

Toll Free

The 505 that I know in the Bayou that is always getting his name called runs a Cookie 16 pill and sold his 32 pill Cookie box.

Don't want to start shit here, but.....

And yet another..  Kid over in your neck of the woods can affirm as to a Texas Star holding up to 20 volts....

My Sweet Sixteen holds together at those levels... So does #12s in Chicago.

So....  To each his own...  But don't name drop thinking that people will be impressed.

And a 32 against a 64?

That is like a 64 pill pirate going against a 32 pill Cookie...  My money will be on the Cookie every day!

Toll Free

In a high current linear amp, you don't want a floating ground system.

They did it back in the CB boom days because of the positive ground vehicles...  Not because it was anything "magic" or because it makes them better...

As a matter of fact, the dual ground thing made the amps more unstable.

Your showing your ignorance again, Mr. 108" antenna.

Only by using it on its side. Laying it on its side will not "ruin" it, if that is what you are asking... If you actually use the antenna (e.g.. talk on the radio) while its on its side, then yes, performance will be hindered and you may ruin your CB.

edgunn@my-deja.com wrote in message <836b45$m0t$1@nnrp1.deja.com>...
|Hey - I park in a garage every day, so I can't leave my antenna mounted
|to my roof (low clearance). It is a
| Wilson 1000 mag mount, so I take it down and put it in the back of my
|SUV, which means it lays on its side for
| a few hours a day. Then I put it back at the exact spot where it was
|previously. Does putting the antenna on its
| side like this affect its performance?
|
| On another note-
| Are there any good CB clubs that operate in the San Diego, CA, area?
|If so, when and on what channel?

I myself prefer the Tektronics scopes, I at one time had a friend in the
military surplus department who really fixed me up, so I got the deal of a
lifetime, it included the tek scope, hp spec analyzer, real nice hp signal
generator, and a hp signal analyzer, it was one of those deals where I
took care of him and he took care of me, He like to run big volts and big
key
andddddddd, well you get the idea.

> !?!?!?!

Yeah it is a common problem with a lot of amps, I probably don't see
near as many as you do, as I work on only my own and good friends, I am an
electrician by trade, but still have seen a lot of them out there that I
personaly could blow in a matter of seconds because of poor craftsmenship.
I do most of my electronics tweeking as a hobby, I like to keydown, and
I'm sure alot of it is a pride thing, I just like to find and fix my own
problems, that way I know exactly how far I can take it... and when you
are drag racing, thats what you have to do sometimes.

I prefer the bias grounded for what I do, but I have played with a
regulator circuit before that kept the voltage stable on the base of the
transistors, hell I ran the thing at 19 volts on side band for a good 20
minutes and never had any problems, and the voltage on the base was the
same at 20 or at 13.8 volts, even under a load, pretty cool, but scary to
test the first time.
Either way, I would not settle for anything less than completly clean
output, throughout the input range.....PERIOD. if there is a bunch of
parasitics, then it isnt right

> The trick about raising drive levels and playing with the keying circuit

How about this one: I want to get rid of the advertiseing at the bottom
of my newsgroup postings and in the orginazation space..... Any
suggestions? I am still one of the last users using Netscape 3 :)

I have acquired a Tram D42, and I was wondering how well this radio is built.  It looks like some o fhte solder joints were crappy, but now that they are fixed everything is A-OK.  It seems maybe someone even swapped the output transistor, does anyone know what should be in it?  Also what exactly does the Delta adjustment do?  I'm going to give the pots and switches a good cleaning and everything should be in order, unless someone has had their fingers in it.  Thanks.

I have one of these units but it is the 40 channel version.  Mine is not mint.  I would be interested to know it's value as well.

Don't think you can get much more mint than that!! Value?? Depends on how bad the buyer wants it!! Being it's a 23 channel, it is more for a collector than a user.  I know Teaberry is legendary, but personally I would place a starting value between $30.00 (Low)     $40.00 (Fair price)  $50.00 (Tops)

Don't mean to offend anyone, but let's face it , CB isn't used much by the mainstream public.  Best of luck,
Ed N3KEX

I've got an IMAX at 55' and couldn't be happier. I had it up higher in the air and found after playing with it, etc. that it worked best at 55'. I don't have any tvi or problems of any kind. I think most interference is caused by poorly tuned radios, foot warmers, etc.

Something in your setup wasn't up to snuff.

I can run 3.0 Kw in my house, and nobody complains... Anything more, and I have one neighbor that I get into.....

When I push over that, More and more people start "arriving" to say hello at my door.

It is all in the COMPLETE setup..

And no, I don't live in the bush... I live in a normal neighborhood... My lot is right about 1/3 acre, and I live in th middle of the subdivision!

> I don't know how all you guys with the "Big Stuff" get away with it. You must all live in the Swamp or 50,000 miles from nowhere. I used to run a 1kw box here at the house in central PA in a populated area, with a Moonraker 4 at 60 ft. with a clean radio and the amp was clean. Never ran till after midnite or selectively during the day, and I still had people beating on the door. One instance in particular someone I knew was eating in a resturant with music coming across the PA system and they heard me shootin' skip over the music TWO MILES down the road. After that report I shut her down.

Usually when you get the squeal on that chassis (the single conversion 8719)
with the volume control, it means one of a couple things (bear with me...

Been a while since I was on one).

The mic is incorrectly wired, or their is a choke on the back of the plug board... It sometimes shorts.

Their is a blown bypass cap, causing RF to get into the thing.

One of the caps in the feedback networks (on the preamp side, that services both the audio preamp and modulation preamp sections... They do double duty) is failing, causing too much feedback in the circuit, causing the squeal..

However, most where fixed with the mic replacement / checking to make sure it was wired correctly (the old G stand D-104 did this when people tried to mod it to work on an electronic switched radio) or the solder connections on the PC board behind the mic jack and it's associated wires where checked.

Because of International Treaty.  For use below 30 megs, above XX watts (the
number escapes me at off top of my head) you have to know CW.  Period.

  Why can't the FCC change the rules and make 27 MHZ a
> Worldwide Communication Band?
```

Because of International Treaty.  For use below 30 megs, above XX watts (the number escapes me at off top of my head) you have to know CW.  Period.

  Like I said before, they sure as hell can
> take away CODE to attain a lesser form of a HAM Ticket.

Only above 30 megs.  Below 30 megs is a completely different ballgame.  That is why all bands above 30 lost the CW requirment, but the bands below kept it.

> I'm done.  I'm never coming back to this thread.

\

Oh well.

Sean wrote:

> Your observation about amps with bias going into oscillation is right on.
> The bias adds stability to the amp.

I find just the opposite. Bias increases the small signal gain. That increases the amplitude of the harmonic and parasitic content.

> If it still oscillates, it is a REAL
> piece of junk or severely out of tune.

In my experience, reducing the bias reduces the level of "garbage" in the output signal when an amp is somewhat unstable. In other words, other factors are the cause of the instability, and adding bias just makes it that much worse.

> The little "blue faces" tend to do
> this and have come WAY down in quality over the years.

I've never seen a Blue Face go into oscillation even when the output SWR is way off. There's a big difference between instability and oscillation. An amp that is oscillating actually runs by itself. An unstable amp has unusually high harmonic and parasitic levels but will not run without an input signal. Oscillation is instability taken to an extreme.

The 200, 250, and 350 XL series Blue Face amps are overbiased when in the "max" position because the bias rides in with the input signal and is reduced right along with the input signal in the lower output positions. This causes a higher level of instability than would ordinarily be seen with lower bias. The solution is simple: either use a lower output setting (avoid the "max" setting) or reduce the bias by clipping a leg of (or removing) one of the bias resistors. The 225s are not overbiased in their highest output position, and the 450s use a very well done, fully regulated and adjustable bias circuit where the bias is separate from the input signal. The 450s can be made more rugged by reducing the bias. It's a simple procedure to change them from AB to very close to B class. There are two bias adjustment pots with arrow-shaped screwdriver slots in them. When stock, the arrows point toward the rear of the amp. Simply turn the left-hand pot to its fully clockwise position, and the right-hand pot to its fully counter-clockwise position.

As for the quality of the Blue Face amps, it hasn't

```
     changed in the time that I've been dealing with them.
     The Blue Face amps still have the best build quality
     I've ever seen in a production (mass-produced) CB amp.

     To Sean:  If you have access to a digital camera,
     we should exchange pictures of the Blue Face amps
     that we've dealt with.  It seems like you've always
     been down on them, and I've always viewed them as
     one of the best.  It's like we're dealing with two
     separate amp lines but calling them by the same name.

PowerStation <8675309@aol.com> wrote in message
news:ffg44.24$O3.5523@news2.voicenet.com...
> I also believe this is why some Cobra 148's and radios of this type show
> amplifiers doing monster watts.
>

Actually,

The MB8719 chassis has been able to show monster Bird watts for quite some time...

This is because of a couple reasons..:

Mainly, the MB8719 chassis does not have the capability for the monster negative carrier shift that the Galaxy and other lines do... This is also the reason that the tonal quality at overmodulation is different. The Galaxies will do "Dog Shit Loud" audio, whereas the 148 will keep a growly loud.

If you look at the scope with the limiter clipped on both the Galaxy and the 148, you will see the line that occurs between peaks is longer on the overmodulated Galaxy (and also on the transformer modulated AM radios).... This is because the moduator transistor (as simple voltage regulator) is designed different (and acts different) than the one in the 148. The Galaxy will hold it negative farther, but the 148 will hold positive longer, effecting more "Bird Forward Swing".

Also, the bias circuit in the 148 final can be fiddled with to give much more forward bump... And that is the easiest way to show 7 or 8 watts Bird on the 148 chassis... Whereas the Galaxy doesn't do this... This has to do with the methods of regulation, as well as interaction with the above mentioned phenomenon.

You can change the biasing of the regulator section of the Galaxy to see nearly the same thing, although when done, the Galaxy does slightly more than the 148 (as it should be, being a double final radio!!!).

Hope this helps.

I can still get the early model HR-2510 (new in box) for around $210.00
(thats assuming it went up from a year ago).

Mdd327 wrote in message <19991214215148.14171.00000930@ng-cn1.aol.com>...

Well, considering it is a Wilson 1000, VSWR would probably still be
reasonable if you were to place this antenna horizontally, though, I
wouldn't necessarily try it.  I've seen (performed) a Wilson 1000 on a
concrete filled metal pole once, and only had 2:1 VSWR.

In any event, STORING it on its side, on the ground (not advisable due to
dirt) will not damage this antenna.

If someone hasn't already told you, there is less noise on FM unless you include the "shot" noise heard in the speaker when the receiver is unsquelched. I figure this noise doesn't really count because you don't leave an FM rcvr unsquelched during normal use.

Under almost all circumstances FM is less prone to most noises than AM.

There was another JB2000 that used a pair of 3-500's and had a
small driver stage tube also. I forget the driver tube number but it
allowed a low power rig to drive the amp to hi output.
The transformers in these were pretty light duty so don't leave
it keyed at full output very long.
I'm afraid I've been out of the CB stuff too long to be able to
give you a recent price on one of these.
BobC.

Prozac,

I have yet to try this, or even give thought to whether or not it would work... But, make yourself a little 5/8 wavelength antenna for channel 3 or 4 (dont have my ARRL handy, so, I have no idea what ranges video/audio would be).... then buy a line amplification unit from Rat Shack, then hook everything up starting with a VCR set to whatever the antenna was built for.....   VCR - Amplification Unit - Antenna

As I said, I haven't even thought about it, but now that I typed it out, it may work to a point, but nothing like a neighborhood type deal.....  There ARE cheap kits usually being auctioned on EBAY..... other than that, do a search on the web...

Hank

Why didn't Ford drop a Cleveland in the current Mustang? Emissions?

It would be interesting therefor to put a Pantera up against a latest
Vette even though they stopped production of the former. There again one
of our 5.0L TVR's will blow them both away.

Phil / UK

JB2000 by blackcat. uses 3-500Z's, 2 of 'em.
```

worth about $350 with mint tubes...
